## Opening the web app

To access the OpenLV web app, go to: <https://openlv-cse.uk>

The screenshot shows the OpenLV website header with the logo "Open LV Your local electricity data". Below the header is a section titled "Community Group Home Page Links" with a list of links: Centre for Sustainable Energy, Marshfield Energy Group, Bath & West Community Energy, Rooftop Housing Group, WHG Housing Association, Exeter Community Energy Ltd, Owen Square Community Energy, and Tamar Energy Community. Below this is a section titled "Background Information" which contains several paragraphs of text describing the project's goals and the roles of various community groups.

**Community Group Home Page Links**

- [Centre for Sustainable Energy](#)
- [Marshfield Energy Group](#)
- [Bath & West Community Energy](#)
- [Rooftop Housing Group](#)
- [WHG Housing Association](#)
- [Exeter Community Energy Ltd](#)
- [Owen Square Community Energy](#)
- [Tamar Energy Community](#)

**Background Information**

OpenLV is trialling some open-source software that monitors electricity substation performance and electricity demand. It's called LV-CAP™.

This website takes data from LV-CAP™ and uses it to show information - in the form of graphs, charts and 'smileys' - about energy use in seven selected communities. The information is anonymous and is the total of all the homes connected to the substation; it doesn't show data for individual households.

The data will give a better understanding of the energy use in the seven communities and help them come up with innovative projects of their own:

**Marshfield Energy Group** will develop an app to allow local people to see real-time energy demand and grid carbon intensity, and adjust their use accordingly. Data will also be used to build a picture of energy use across the village and explore ideas for making the village more sustainable.

**Bath & West Community Energy** will use OpenLV data to develop a demand management app to enable homeowners to adapt their energy use and encourage the take up of battery storage and solar PV.

**Tamar Energy Community's** project will centre around awareness raising, changing energy use behaviour, and the development of local tariff models.

**Rooftop Housing Group** will trial an app on a housing development in Cheltenham that will give residents access to their community's real-time electricity demand, with the intention of raising awareness and changing energy use behaviour.

**WHG Housing Association** will develop an app for use in a single tower block that will help drive forward an electric heating retrofit project and help residents make the most of a new tariff that rewards off-peak electricity consumption.

**Exeter Community Energy Ltd** will develop an app to show local users energy use at substation level, data on local generation from assets owned by the group, and information about national grid carbon intensity. They also plan to use data to explore the possibility of time-of-use tariffs, and for the expected increase in electric vehicle use.

And finally, **Owen Square Community Energy** will use substation data to promote take up of low carbon technologies by local households and match up solar PV and heat pump installations in a way that optimises the output of the local low voltage network.

The app that this website uses to present data from LV-CAP was developed by the Centre for Sustainable Energy.

OpenLV is managed by EA Technology and is being run in Western Power Distribution's licence areas (the Midlands, the South West and South Wales).

- This will take you to the web app, with some background information about the project. Visitors to the website can click on each group's pages to see graphs that have been set up, but without logging in as a group member, website users (i.e. members of the public, or members of other groups) will not be able to make changes to the graphs.

## Logging in

- To choose what graphs you display on your page, configure graph settings, setup alerts or tariffs, you will need to click on the link for your group, and click the **login link** on the top right hand corner of the home page.
- To **login**, enter a username and password which is unique to your group. CSE will send you your individual login details (NOTE: You will have ONE login per group).

## Tabs in the web app

Once logged in, you will see a number of tabs at the top of the page (see image below):

- Graphs** displays the graphs, or graph sets that you have chosen.
- Graph configuration** allows you to set up new graph sets, or change existing ones.
- Alert configuration** allows you to set up email alerts to members of your community.
- Tariff configuration** allows you to set up different modelled tariffs.
- Data amalgamation** allows you to combine the values from one or more data sources into a single data source.
- PV estimation** allows you to estimate the output of any PV array in your community.

## Graph configuration

The tab called “**Graph Configuration**” will take you to a page where you can create new graph sets, or edit existing ones (by adding/removing graphs from the graph set).

**Select / Add a Graph Set**

Add New Graph Set:  Add New

-OR-

Select Graph Set: Display St Martins Delete Selected

---

**Add Graphs to Graph Set**

Enter Graph Name	Select Graph Type	Select Data Sources	
<input type="text"/>	Bar Chart	Data Category	Data Sub-Category
	1	Not required	Not required
	2	Not required	Not required
	3	Not required	Not required
	4	Not required	Not required
	5	Not required	Not required

Add

---

**Existing Graphs**

Graph Name	Graph Type	Data Sources	Remove
------------	------------	--------------	--------

## HOW TO ADD GRAPHS TO A GRAPH SET

- Go to the “Graph Configuration” tab
- Enter a name for the graph you’re creating
- To choose what to display, select from the dropdown options (described below). Each graph set can contain up to 5 graphs (i.e. line graph / bar chart / smiley).

**Enter Graph Name:** Chose a name that represents what the graph / barchart / smiley represents, for example: “Main Street Voltage” or “Carbon intensity, all feeders).

**Select Graph Type:** You can choose how to display your data - as a Line Graph, a Bar Chart, Stacked Bar Chart or Smiley (see note on Smileys below).

**Data Category:** This is the data you want to display (and the units which are used). It is advisable to display similar data for the 3 graphs, e.g. all three “Voltage (V (average)” or “Voltage (V) (average)”, “Voltage (V) (min)” & “Voltage (V) (max)”.

**Data Sub-Category:** This is where the data comes from, or the ‘level’ your data is being shown at – i.e. whole group, substation, feeder, or phase.

*Select / Add a Graph Set*

Add New Graph Set:  Add New

-OR-

Select Graph Set: test 1 Delete Selected

*Add Graphs to Graph Set*

Enter Graph Name	Select Graph Type	Select Data Sources	
		Data Category	Data Sub-Category
Carbon intensity (bar)	Bar Chart	1 Carbon (gCO <sub>2</sub> )	Community Group (Total)
		2 Not required	Not required
		3 Not required	Not required
		4 Not required	Not required
		5 Not required	Not required

Add

Click ‘Add’ to save this graph or graph set. Your graph will appear in an ‘existing graphs’ box at the bottom of the page.

Carbon intensity (bar)	Bar Chart	Data Category	Data Sub-Category	<span>Remove</span>
		Carbon (gCO <sub>2</sub> )	Community Group (Total)	

## UNDERSTANDING THE DATA CATEGORIES

As mentioned above, the “**data category**” is the data you want to display and the units which they are displayed in. There are a number of data categories that are being monitored by the LV-Cap unit in the substation and each shows different things. Here are all the types of data categories you can chose from:

The headings below outline the key data categories that we think will be of most use. If you would like to know about others then get in contact with us.

Amalgamated  
 Carbon (gCO<sub>2</sub>)  
 Carbon Intensity (gCO<sub>2</sub>/kWh)  
 Cost (£)  
 Current (A) (average)  
 Current (A) (max)  
 Current (A) (min)  
 Current (A) (number)  
 Current (A) (std. dev.)  
 Energy, Active (Wh) (average)  
 Energy, Active (Wh) (number)  
 Energy, Reactive (VArh) (average)  
 Energy, Reactive (VArh) (number)  
 PV Array (KWh)  
 PV Array (NREL estimate) (KWh)  
 Phase Angle (°) (average)  
 Phase Angle (°) (max)  
 Phase Angle (°) (min)  
 Phase Angle (°) (number)  
 Phase Angle (°) (std. dev.)  
 Power, Active (W) (average)  
 Power, Active (W) (max)  
 Power, Active (W) (min)  
 Power, Active (W) (number)  
 Power, Active (W) (std. dev.)  
 Power, Reactive (VAr) (average)  
 Power, Reactive (VAr) (max)  
 Power, Reactive (VAr) (min)  
 Power, Reactive (VAr) (number)  
 Power, Reactive (VAr) (std. dev.)  
 Reverse Alert Count  
 School (KWh)  
 Tariff Rate (p/kWh)  
 Temperature (average)  
 Temperature (max)  
 Temperature (min)  
 Temperature (number)  
 Temperature (std. dev.)  
 Voltage (V) (average)  
 Voltage (V) (max)  
 Voltage (V) (min)  
 Voltage (V) (number)  
 Voltage (V) (std. dev.)  
 Wind Turbine (KWh)

### **Carbon (gCO<sub>2</sub>)**

This is based on “energy active” and measures the carbon intensity of energy being used from the grid at a given time compared to a past period (which you set). In other words, it shows for every Wh used, the amount of grams of CO<sub>2</sub> created. The carbon intensity data is taken from the national grid’s regional averages.

*NOTE: You can also plot the regional and national carbon intensity data by selecting the data category “Carbon Intensity (gCO<sub>2</sub>/kWh)” to see how your community compares with the regional or national carbon intensity values.*

### **Cost (£)**

This shows how much the community is spending on energy used. It is measured by multiplying the “energy active” by the unit rates set when configuring tariffs.

Please note that this can show how much a number of houses (at community, substation or feeder level) are spending but it does not show the costs per individual household. To show this, you could divide the unit rate by the number of households when setting your tariff – when creating your cost graph according to this tariff then this would show the average bill for individual houses.

*NOTE: The cost is calculated using historical data and as such you cannot apply a new tariff to old data. If you want to create a new tariff, you will need to wait a bit to be able to apply it to create a cost graph.*

*NOTE: You can also plot the tariff rate (p/kWh) now by selecting “Tariff Rate” in the data category list.*

### **Energy Active (Wh) (total)**

This shows the net amount of electricity being used by a community, and is used to calculate how much the community is spending on electricity and how much CO<sub>2</sub> is being generated by the electricity being used. It is “net” because local generation has been subtracted from how much energy is being used to create this value.

*NOTE: If you set it to (number) instead of (total), this would show all the readings taken in the last half hour – if not 30 then there is an issue.*

### **Power, Active (W)**

This is the average power\* being used.

*\* NOTE: Power is the rate of energy transfer at a moment in time, it is instantaneous and is calculated by Voltage x (Active) Current.*

NOTE: When looking at a Power, Active (W) (average) graph compared to an Energy Active (Wh) (total) graph, they will look very similar. The only difference is that the value for Energy will be half of what it is for Power, and in different units – this is because Power is multiplied by time used to give Energy. In the case of these graphs, this is always in 30 minute bundles. For example, if in a half hour the average Power being used is 70,000 W, then the Energy being used will be 70,000 W x 0.5 (half an hour) = 35,000 Wh.

*NOTE: If you select (max) instead of (average) this would show what the maximum amount of power that was used in the last half hour.*

### Current (A), (average) & (max)

The average current value for a substation shows the transformer load. It includes both active and reactive power. When combined with a temperature graph, this is a useful indicator of whether substations are being overloaded – this is important to see whether the substation has capacity to take on extra load (from local generation...).

The max current value for a substation or feeder is useful to see if the substation or feeder protection (fuses or circuit breakers) is likely to trip turning off the supply.

### Temperature

This is the temperature of the substation and can show when the substation is under pressure. The most useful data sub-category to choose for this is “Transformer” under substation name – this shows the temperature of the oil inside the transformer. “Inside” and “Outside” can be selected to show the air temperature inside/outside the substation.

## UNDERSTANDING THE DATA SUB-CATEGORIES

- The “**data sub-category**” is where the data comes from, or the ‘level’ your data is being shown at – i.e. whole group, substation, feeder, or phase – you will get to choose this once you have decided what data category you are going to show on a graph.
- On the list of data sub-categories, you can choose which **substation** to display data for (if you are having more than one substation monitored).
- By selecting the option “**community group total**” you will be able to see total data for all the substations being monitored if several substations are being monitored
- *OR* if one substation is being monitored, if you select “**substation feeder total**” this would show the total for the whole substation.
- If you want more granularity in your data, you can narrow down your data to **feeder**, by selecting “[name of feeder](Total)” or even **phase level** by selecting “([name of feeder] (L1), [name of feeder](L2)...”).

## Displaying Graphs

### DISPLAYING GRAPHS

- On your home page, by clicking “**Graphs**” at the top, you will be taken to a page where you can chose what graph sets to display and adjust the time period the graphs cover (see below).

The screenshot shows the 'Configuration' page in the OpenLV app. At the top, there is a navigation bar with the following items: 'Group Home', 'Graphs' (highlighted), 'Graph Configuration', 'Alert Configuration', 'Tariff Configuration', 'Data Amalgamation', and 'PV Estimation'. A 'Logout' button is in the top right corner. The main content area is titled 'Configuration' and contains several settings:

- Graph Set:** A dropdown menu set to 'Display Withly'.
- Date/time mode:** Radio buttons for 'Fixed range' and 'Automatically updating range' (selected).
- Duration:** A dropdown menu set to '1 hour'.
- Average data over:** A dropdown menu set to 'Off (30 minutes)'.
- Options:** A grid of checkboxes:
  - Multiple Y-Axis Ranges
  - Do not extrapolate
  - Do not display graphs
  - High Contrast Colours
  - Start Y-Axis from Zero
  - Display data in tables

A 'Display Graphs' button is located at the bottom right of the configuration area.

*NOTE: You can see under options there are four tick boxes. See below in “Some Notes on Displaying Graphs” about what each option means.*

- Click on the ‘Graphs’ tab and select the graph you want to display.
- Set the date/time mode, and the date range

*NOTE: See in “Some Notes on Displaying Graphs” for what the “Average data over” means.*

- Select your options (see below for what they are)
- Click ‘display graphs’

### SOME NOTES ON DISPLAYING GRAPHS

#### Average data over:

Underneath where you chose what graph set you want to display, you can also chose what your time intervals will be on your x-axis by selecting this in the “Average data over” axis. As it is normally, the data will be shown for however long you’ve chosen when you set the duration, but in intervals of 30 minutes. You can change this using this drop down if, for example, you want to show data for 1 year but in intervals of 1 week rather than 30 minutes.

**Configuration**

Graph Set:  
 Display Withy

Average data over:  
 Off (30 minutes)  
 Off (30 minutes)  
 1 day  
**1 week**  
 1 month  
 6 months  
 1 year

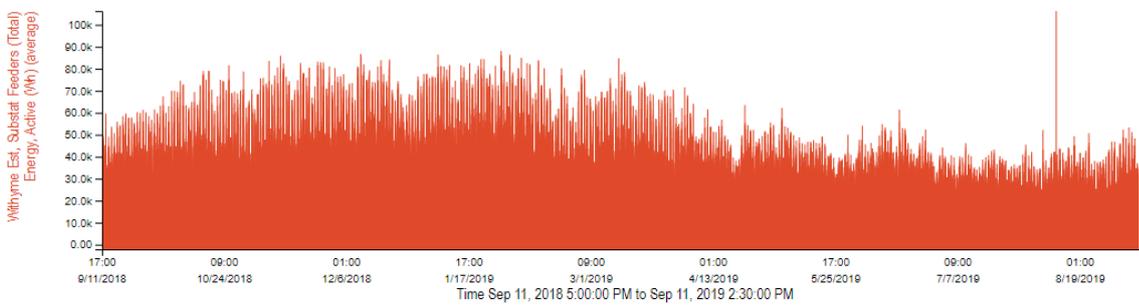

Date/time mod  
 Fixed range  
 Automatic

Do not extra  
 Start Y-Axis

This graph below shows the electricity being used by one feeder for a whole year by 30 minute time intervals.

**Active Energy**

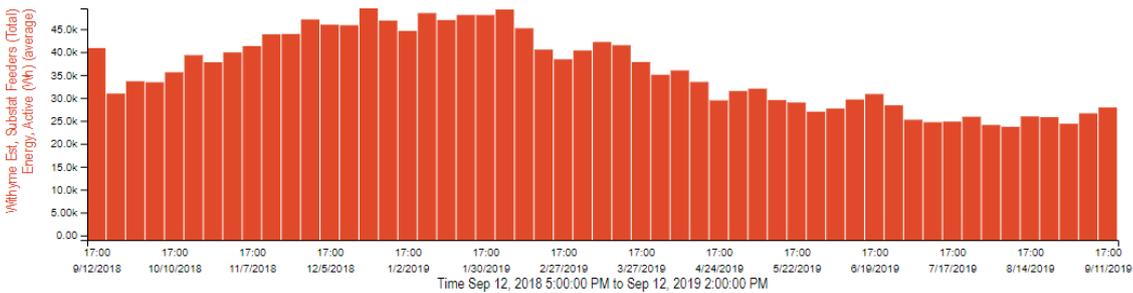

(The time range has been cut short to Sep 11, 2018 5:00:00 PM to Sep 11, 2019 2:30:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

The graph below shows the same data but in 1 week time intervals.

**Active Energy**

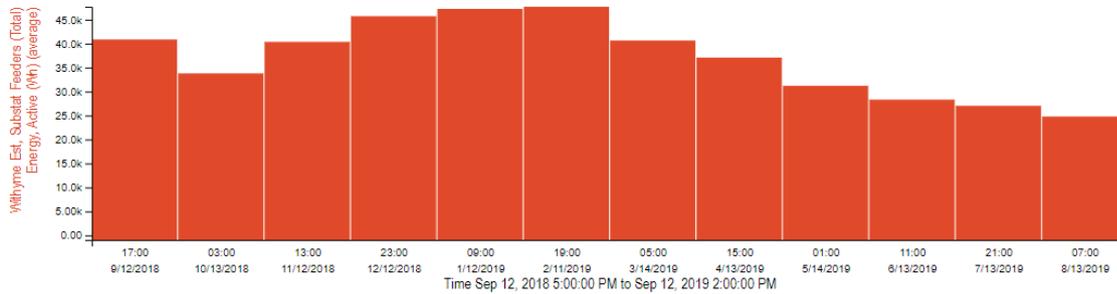

(The time range has been cut short to Sep 12, 2018 5:00:00 PM to Sep 12, 2019 2:00:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

The graph below shows the same data but in 1 month time intervals.

**Active Energy**

(The time range has been cut short to Sep 12, 2018 5:00:00 PM to Sep 12, 2019 2:00:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

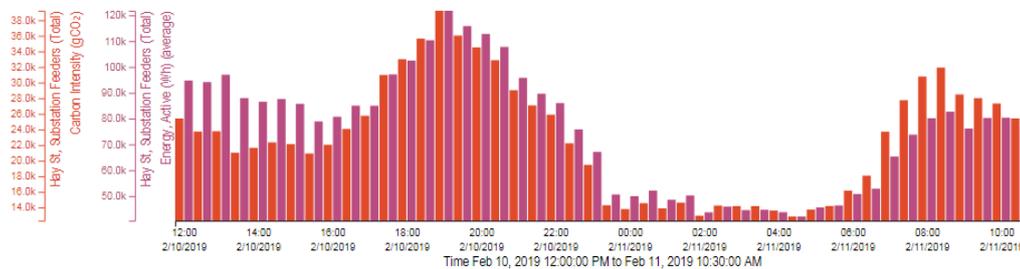

There are 4 option tick boxes you can see in the above screenshot:

- **“Multiple Y-Axis Ranges”**: This would mean that you can display multiple different data categories that have different units and values on independent y-axes. This is useful if you want to display multiple data sets with different value ranges and units, so you can now compare multiple different data categories on the same graph instead of separate ones. If ticked your graph would look like this:

**Total**

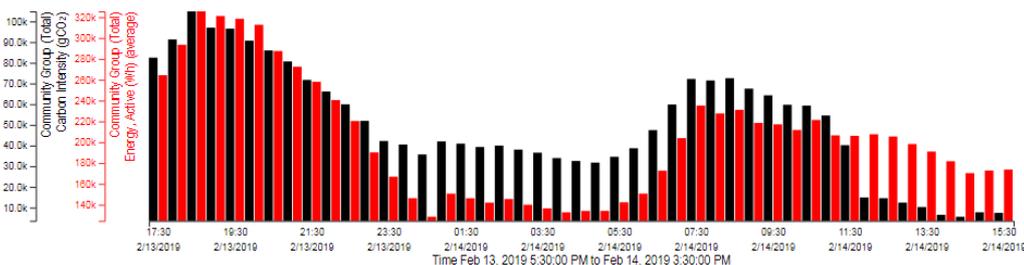

(The time range has been cut short to Feb 10, 2019 12:00:00 PM to Feb 11, 2019 10:30:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

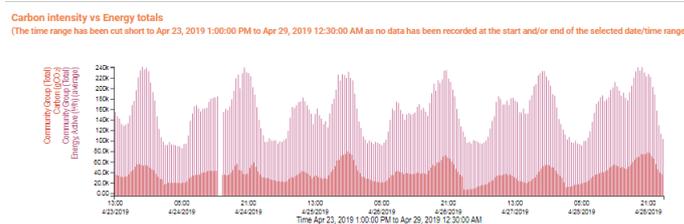

- **High Contrast Colours”**: This option has to do with the colours your graphs are displayed in. You might want to select this option if you wish to make your different data sets more visible. If ticked your graphs would look like this:

**Carbon intensity vs Energy totals**

(The time range has been cut short to Feb 13, 2019 5:30:00 PM to Feb 14, 2019 3:30:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

- **“Do not extrapolate”**: The extrapolate function fills in one missing value with the average of the values either side - – this is useful for hourly data or if there are gaps in the data so that the graph shows something rather than nothing. This function is a default option which you can now turn off using this tick box.
- **“Start Y-axis from Zero”**: Instead of the y-axis starting from the minimum value, if this box is ticked then the y-axis will start from 0.
- **“Do not display graphs”**: If selected together with the “display data in tables” function (below) then this would only display the data in HTML table format.
- **“Display data in tables”**: By selecting this option, you can display the data behind graphs as HTML tables.

Carbon intensity vs Energy totals	Community Group (Total) Carbon (gCO2)	Missing	Community Group (Total) Energy Active (Wh) (average)	Missing
2019-04-23T12:00:00Z	37720.387475999996	False	155227.931999999997	False

**Date/time mode:**

**‘Fixed range’** means you specify the exact time or date range you want to display (each time you open the graph / graph set).

**‘Automatically updating range’** means that when you open the graph, it will automatically update the data it contains to show data up to the current time for the period you have selected (e.g. the previous week). As new data is received it will be displayed. Note, in this mode, the selection options are hidden when the graphs are displayed. This is so the graphs can be used on a display screen.

**Using the data ranges:**

When you create a graph, the **x-axis** shows the overall start and end date/time and individual times and dates. If the date / time range you selected has been shortened, due to data being unavailable, a message saying this will be displayed.

The **y-axis** range is from the minimum value in the data being displayed to the maximum unless you tick the option box **“Start Y-axis from Zero”** in the graph display page.

**Displaying multiple data types in one graph:**

You can plot multiple datasets on one graph if they have the same units You can display multiple data types (up to 5) in one graph by ticking the **“Multiple Y-Axis Ranges”** option tick box. This allows different units and ranges of values to be displayed on one graph meaning you can display different types of data to compare.

You do not need to use this function if you are displaying the same data type but for different areas – for instance, you could plot the energy use for 3 different feeders on one graph for comparison using the same Y-axis as different colours will represent different feeders.

It is impossible to have more than one data type on one smiley.

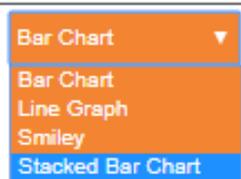

**Displaying smileys:**

The smiley which is displayed shows a range of ‘smiles’, going from very happy to very sad, for the point in time you’re looking at the graph, **compared to the average for the period of time you select in the dropdown.**

**Stacked bar charts:**

You can select “stacked bar chart” as a graph type when configuring graphs for multiple data sources.

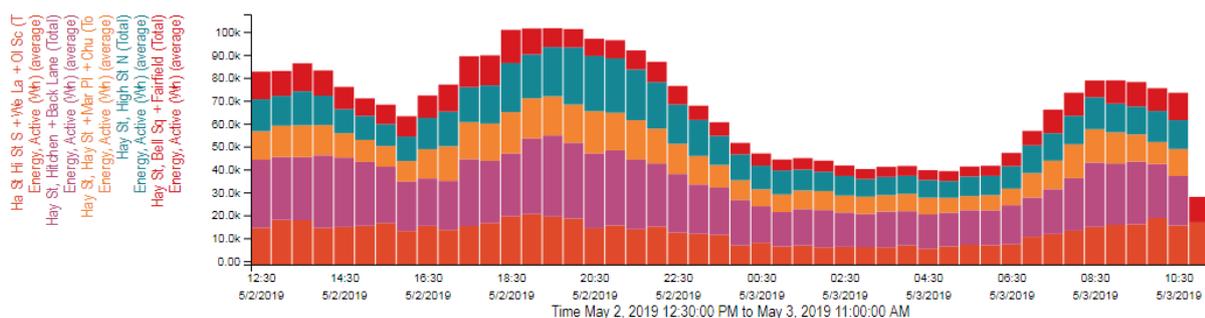

Select Graph Type

Here is what a stacked bar chart would look like:

**Stacked energy use**

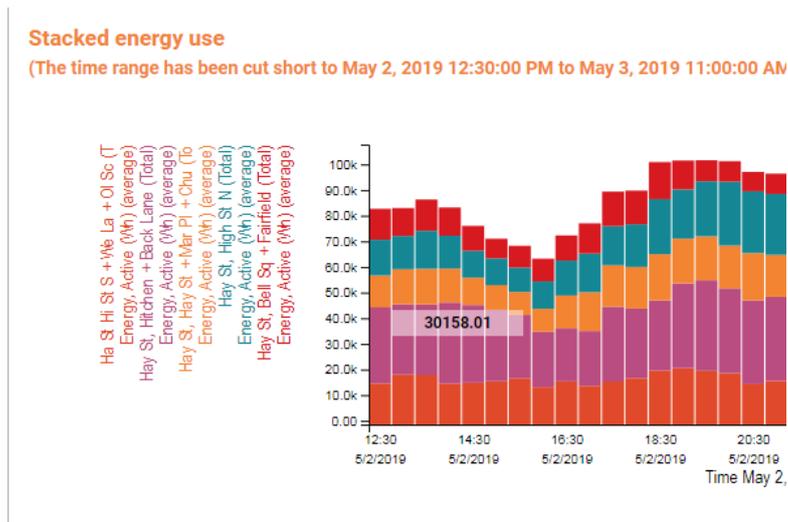

(The time range has been cut short to May 2, 2019 12:30:00 PM to May 3, 2019 11:00:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

*NOTE: You could use this graph type to show the individual feeder values and the feeder total at the same time, i.e. by creating a stacked chart with all the feeders on for a substation, the top of each bar would be the substation total and the individual feeder values would also be visible. The same applies for phases and feeder totals, and for substations and group totals.*

**Values behind bar charts:**

For data displayed as bar charts (both stacked and non-stacked), you can see the data behind the bars by hovering the cursor over them.

**HOW TO CHANGE EXISTING GRAPHS**

At the bottom of the “Graph Configuration” page, you will see a button to remove the existing graphs in your graph set. This is where the graphs that you create will appear as well.

**Existing Graphs**

Graph Name	Graph Type	Data Sources	Remove
Voltage	Bar Chart	Data Category	Remove
		V_MEAN IX_MEAN	

**EXAMPLE GRAPHS**

In this section, we will present some example graph sets you may find useful with some instructions on how to create them. Instead of focusing on one type of data-category, we have tried to create meaningful bundles of graphs showing different data-categories.

*NOTE: The “Existing Graphs” screenshots are taken from the “Graph Configuration” page, whilst the graph screenshots are taken from the “Graphs” tab once graphs have been displayed for a specified time period.*

**Changing energy behaviours (community)**

This shows the energy use, carbon intensity and cost data for **all houses on the substation**. The last “Energy, CO2 and Cost” smileys is a more user-friendly way of viewing how a community is doing in terms of their energy use, carbon intensity and cost of energy used at the present time compared to the set time period.

This specific graph set is showing energy patterns for all houses on the Meavey Way substation (this was done in Tamar Energy Community’s web platform).

**Existing Graphs**

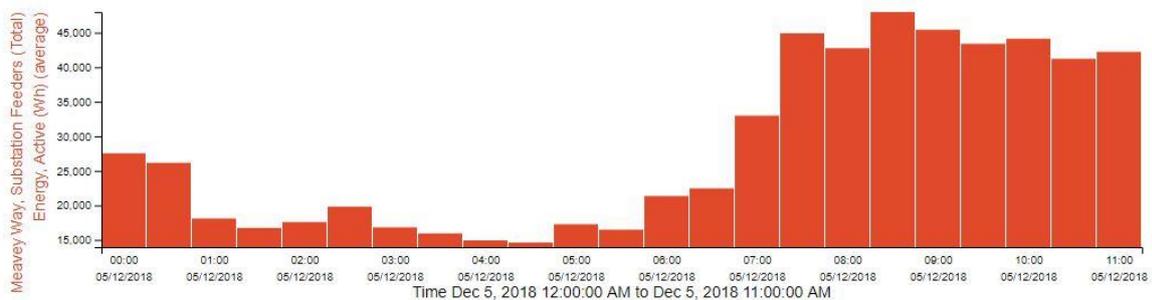

Graph Name	Graph Type	Data Sources	Remove
Energy use for Meavey Way	Bar Chart	<b>Data Category</b>	<b>Data Sub-Category</b>
		Energy, Active (Wh) (total)	Meavey Way, Substation feeder total
Carbon Intensity for Meavey Way	Bar Chart	<b>Data Category</b>	<b>Data Sub-Category</b>
		Carbon Intensity (gCO <sub>2</sub> )	Meavey Way, Substation feeder total
Cost for Meavey Way	Bar Chart	<b>Data Category</b>	<b>Data Sub-Category</b>
		Cost (£)	Standard tariff : Meavey Way, Substation feeder total
Energy, CO2 and Cost for Meavey Way	Smiley	<b>Data Category</b>	<b>Data Sub-Category</b>
		Energy, Active (Wh) (total)	Meavey Way, Substation feeder total
		Carbon Intensity (gCO <sub>2</sub> )	Meavey Way, Substation feeder total
		Cost (£)	Standard tariff : Meavey Way, Substation feeder total

**NOTE:** By selecting “substation feeder total” when selecting a data sub-category, this shows the data for the whole substation. If you were monitoring more than one substation and wanted to show all of the community you would select “community group total”.

**NOTE:** Here, the tariff we have chosen is called “standard tariff” – yours may have a different name depending on how you configured your tariff in the “tariff configuration” tab.

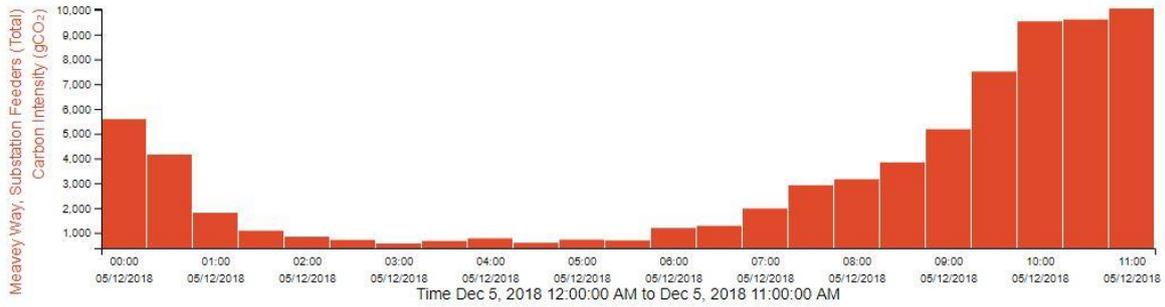

**Energy use for Meavey Way**

(The time range has been truncated to Dec 5, 2018 12:00:00 AM to Dec 5, 2018 11:00:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

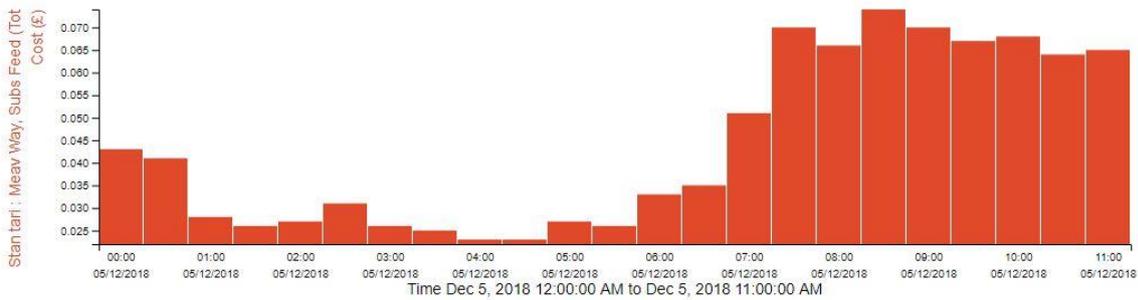

**Carbon Intensity for Meavey Way**

(The time range has been truncated to Dec 5, 2018 12:00:00 AM to Dec 5, 2018 11:00:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

**Cost for Meavey Way**

(The time range has been truncated to Dec 5, 2018 12:00:00 AM to Dec 5, 2018 11:00:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

**Energy, CO2 and Cost for Deer Park Meavey Way**

(The time range has been truncated to Dec 5, 2018 12:00:00 AM to Dec 5, 2018 11:00:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

**Meavey Way, Substation Feeders (Total)  
Carbon Intensity (gCO<sub>2</sub>)  
Dec 5, 2018 11:00:00 AM**

**Stan tari : Meav Way, Subs Feed (Tot  
Cost (£)  
Dec 5, 2018 11:00:00 AM**

### Changing energy behaviours (one feeder)

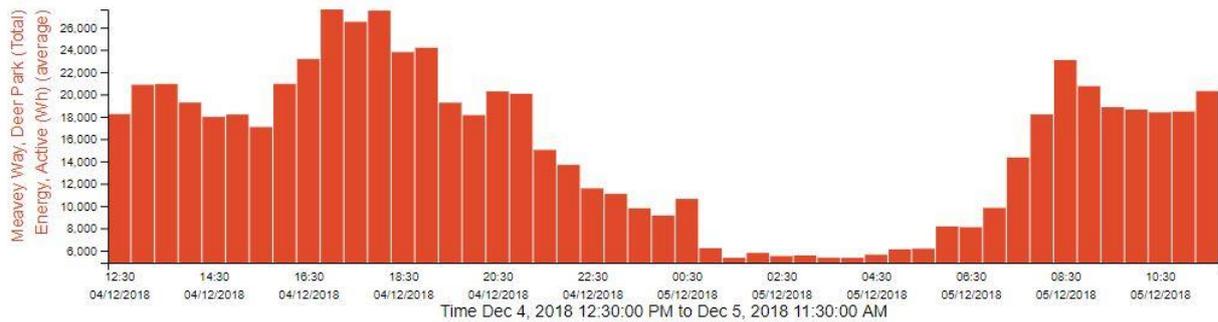

As with the previous graph set, this shows the same data but in more detail, focusing on one feeder (here, Deer Park). This is useful if you want to focus your energy reduction initiatives on one street.

#### Existing Graphs

Graph Name	Graph Type	Data Sources	Remove
Energy use for Deer Park	Bar Chart	<b>Data Category</b>	<a href="#">Remove</a>

**Transformer Monitoring**

This particular graph set is useful for groups to use to monitor the substation’s health. The criteria of health that we’ve chosen here is the temperature of the transformer (measures the temperature of the oil in the transformer). We’ve chosen to present this alongside the average current which includes both active and reactive power. This combination of graphs is a useful indicator of whether a substation is being overloaded. If this is very high and coincides with high energy use, then it is likely that the substation is being overloaded, making it at risk of overheating.

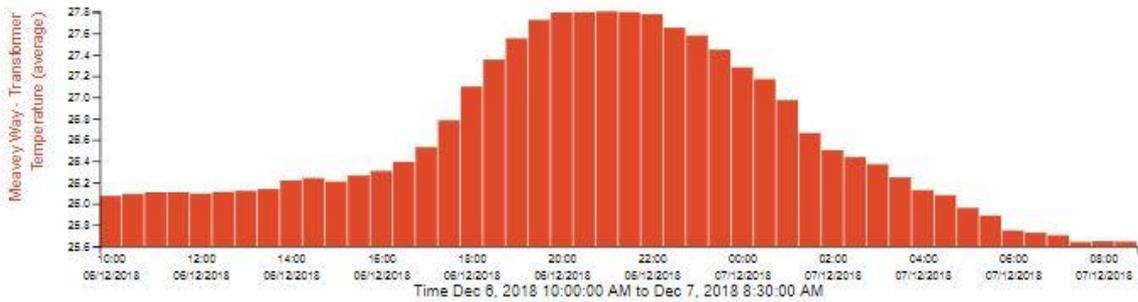

We have included current for the total substation as well as for each feeder – this is useful to see which street is causing the most stress on the substation health.

## Alert Configuration

You can set up alerts in the “Alert Configuration” tab. This means that a text or email can be sent out to people who sign up to alerts when a value exceeds or drops below a specified threshold. This could be useful to notify people for example when the community is using a lot of energy or when the temperature of the transformer is too high so that they can take action and reduce their usage. Below is a step-by-step guide on how to create an alert.

- Click on ‘Alert Configuration’ tab
- First you must create an **Alert Destination** (who your alert will be sent to). If you get a series of houses on a substation/feeder to sign up to alerts, our recommendation would be to set up a group email address that everyone can have access to. Here we decided to call it Deer Park (the alert will be sent to the houses on the Deer Park feeder) and used [deerpark@gmail.com](mailto:deerpark@gmail.com) as an example group email.

*NOTE: Some email service providers have a function whereby you can set a filter to automatically forward emails with a specified subject line to other email addresses. You could use this function if you wanted to automatically forward all alert emails (so emails with a ‘OpenLV alert’ subject line) to be forwarded to a number of people who have signed up to receiving alerts. By using an Email-to-SMS gateway software, you can set this so that these emails are forwarded in the form of texts. The following links offer more information on this:*

- Automatically forwarding group emails to specified individual email recipients

<https://www.makeuseof.com/tag/how-to-auto-forward-emails-to-multiple-addresses-in-gmail/>

- Automatically forwarding email to a number - <https://www.youtube.com/watch?v=quqAlapMoWI>

- Email-to-SMS gateway service offered by TextLocal: <https://www.textlocal.com/integrations/email-to-sms/>

### Create an Alert Destination

Name

Deer Park

Email address

deerpark@gmail.com

Send in text format

Send detailed messages

Add Destination

- In the above screenshot you can see two tick boxes – “Send in text format” and “Send detailed message” – this is the level of detail you want within the message to be sent out. The screenshots below show how these options differ.

**Subject:** [OpenLV] Alert: (QA) Transformer Temp  
**Date:** Fri, 18 Jan 2019 01:12:32 +0000

OpenLV Alert '(QA) Transformer Temp'. Go here to confirm action: <https://olv-cse-qa.co.uk/marshfield/ra?a=23>

The above message is in simple text format – you can set this by only ticking “Send in text format”

**Subject:** [OpenLV] Alert: (QA) Transformer Temp  
**Date:** Fri, 18 Jan 2019 01:12:32 +0000

OpenLV alert notification '(QA) Transformer Temp': Value 'Withymead Est - Transformer Temperature (average)' has changed from 17.17 to 16.7033, crossing the threshold value of 17.0 between Jan 18, 2019 12:00:00 AM and Jan 18, 2019 12:30:00 AM. To confirm you have acted on this alert go here: <https://olv-cse-qa.co.uk/marshfield/ra?a=24>

The above message is in detailed text format – you can set this by first ticking “Send in text format” then clicking “Send detailed messages”.

**Subject:** [OpenLV] Alert: (QA) Transformer Temp  
**Date:** Fri, 18 Jan 2019 01:12:32 +0000

**Open LV** Your local electricity data  
**Marshfield Energy Group**

**Alerts**

OpenLV alert notification '(QA) Transformer Temp': Value 'Withymead Est - Transformer Temperature (average)' has changed from 17.17 to 16.7033, crossing the threshold value of 17.0 between Jan 18, 2019 12:00:00 AM and Jan 18, 2019 12:30:00 AM

To confirm you have acted on this alert go [here](#)

[Group Home](#)

The above message is in detailed HTML format – you can set this by only ticking “Send detailed messages”.

**Subject:** [OpenLV] Alert: (QA) Transformer Temp  
**Date:** Fri, 18 Jan 2019 01:12:33 +0000

**Open LV** Your local electricity data  
**Marshfield Energy Group**

**Alerts**

OpenLV Alert '(QA) Transformer Temp': Go [here](#) to confirm action

[Group Home](#)

The above message is in simple HTML format – you can set this by not ticking either box.

- Once you have created an Alert Destination, you can **create your alert**. The screenshots below show this for two types of alerts – :
  - Alert people when combined energy used by households on the Deer Park feeder exceeds 45,000 Wh
  - Alert people when the temperature of the transformer on the Meavey Way substation exceeds 25°
- Similar to configuring graphs, you will have to choose a data category and sub-category depending on what you want to send alerts for and for which feeder/substation. Once you have decided this, you will need to provide a threshold value. Once the data exceeds or drops below this value, an alert will be sent.

*NOTE: You can create an alert using an amalgamated data source.*

- Finally, you must chose an alert destination. from those you have already added (likely to be a group email address)

**Create an Alert**

Name	<input type="text" value="Reduce your energy use!"/>
Category	<span>Energy, Active (Wh) (average) ▾</span>
Sub-Category	<span>Meavey Way, Deer Park (Total) ▾</span>
Alert threshold value	<input type="text" value="45000.0"/>
Send alerts when value exceeds the threshold	<input checked="" type="checkbox"/>
Send alerts when value drops below the threshold	<input type="checkbox"/>
Alert destination	<span>Deer Park (deerpark@gmail.com) ▾</span>

Add Alert

**Create an Alert**

Name	<input type="text" value="Transformer is too hot!"/>
Category	<span>Temperature (average) ▾</span>
Sub-Category	<span>Meavey Way - Transformer ▾</span>
Alert threshold value	<input type="text" value="25.0"/>
Send alerts when value exceeds the threshold	<input checked="" type="checkbox"/>
Send alerts when value drops below the threshold	<input type="checkbox"/>
Alert destination	<span>Meavey Way (meaveyway@gmail.com) ▾</span>

Add Alert

- Once you have set up your alerts, you will be able to see them in “Existing Graphs” (below)

**Existing Alerts**

Name	Category	Sub-Category	Alert Threshold Value	Send on exceeds	Send on below	Destination	Cancel
Reduce your energy use!	Energy, Active (Wh) (average)	Meavey Way, Deer Park (Total)	45000.0	Yes	No	Deer Park	<a href="#">Cancel</a>
Transformer is too hot!	Temperature (average)	Meavey Way - Transformer	25.0	Yes	No	Meavey Way	<a href="#">Cancel</a>

**REVERSE ALERTS**

- Once you’re alerts have been set, people signed up to the alerts will receive an email (or text) with a link they should click on to confirm they have taken action. When they click on the link they will be re-directed to the web-app page (see screenshot below).

- You can then see how many people have acted on the alerts by creating a **Reverse Alert Count** graph in the “Graph Configuration” tab. Select the options indicated in the screenshot below:

**Add Graphs to Graph Set**

Enter Graph Name	Select Graph Type	Select Data Sources			
		Data Category	Data Sub-Category		
Reverse Alerts Deer Park	Bar Chart	1	Reverse Alert Count	Reduce your energy use!	<a href="#">Add</a>
		2	Not required	Not required	
		3	Not required	Not required	

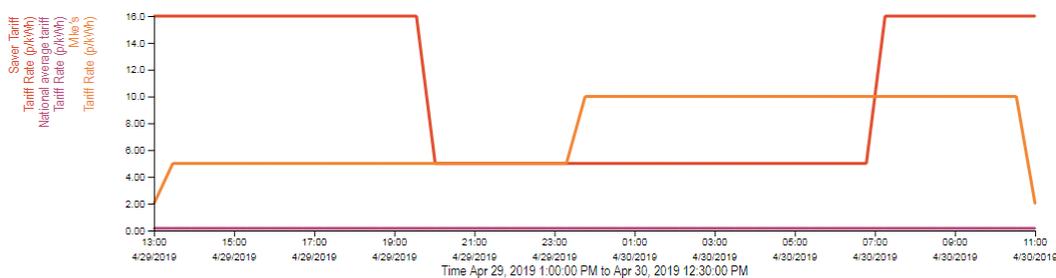

## Tariff configuration

You can set a tariff to show cost graphs in your graph sets. These can be used to see how much your community is collectively paying for their energy use.

*NOTE: The cost is calculated using historical data and as such you cannot apply a new tariff to old data. If you want to create a new tariff, you will need to wait a bit to be able to apply it to create a cost graph.*

You can also plot the tariff rate itself on a graph by using the "Tariff Rate" in the "Data Category" list when configuring graphs. This is what it would look like:

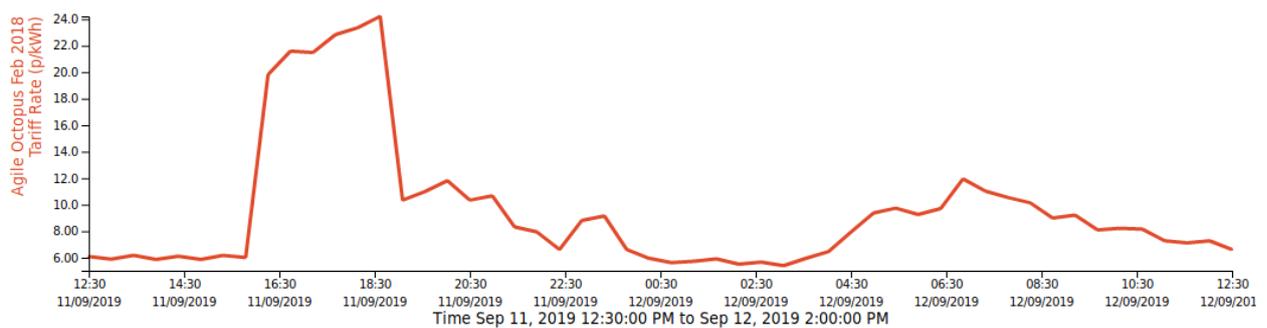

Tariff rate

If you were to plot the Octopus Energy’s “Agile Octopus” flexible time-of-use tariff (see page 30), it would look like this:

Agile Octopus Cost

(The time range has been cut short to Sep 11, 2019 12:30:00 PM to Sep 12, 2019 2:00:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

## SINGLE RATE TARIFF

Below is an example of how to configure a basic tariff for the week:

- Go to the “Tariff Configuration” tab

Add a new tariff – here we’ve decided to call it “standard tariff”. But you can chose whatever name you want. Once you’ve added a new tariff, you can select it to start configuring.

### Select / Add a Tariff

Add New Tariff:

-OR-

Select Tariff:

Add your unit rate for your tariff. Here, we’ve gone with 15.49 p/kWh. You can select your start and end times and the days the rates apply. This is a more useful function when you have a dual, or multi rate tariff (i.e.- time of use tariff). Remember to press “Add”.

### Add Tariff Rate

Cost (p/KWh)	Start Time	End Time	Days
<input type="text" value="15.49"/>	<input type="button" value="00:00"/>	<input type="button" value="00:00"/>	<input checked="" type="checkbox"/> M <input checked="" type="checkbox"/> T <input checked="" type="checkbox"/> W <input checked="" type="checkbox"/> T <input checked="" type="checkbox"/> F <input checked="" type="checkbox"/> S <input checked="" type="checkbox"/> S <input type="button" value="Add"/>

You can also set your standing charge. Here, we’ve set it at 21.15 p/day. Remember to press “Set”

### Set Standing Charge:

p/day

**NOTE: The above unit cost (15.49 p/kWh), which includes VAT, is based on DBEIS Quarterly Energy Prices June 2017 pg 44-46**

[https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/622608/QEP\\_Q117.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/622608/QEP_Q117.pdf)

**The standing charge of 21.15p/day is based on £77 a year – a figure taken from the Energy Saving Trust.**

- Once you’ve set both your unit rate(s), and your standing charge, the full tariff details will be displayed:

### Tariff Details

Cost (p/KWh)	Start Time	End Time	Days
15.49000	00:00	00:00	Mon Tue Wed Thu Fri Sat Sun <input type="button" value="Delete: Rate"/>

Standing Charge: 21.15000 p/day

Validation:  
Valid

## TIME OF USE TARIFF

You can use the web platform to model a time of use tariff by configuring a multi-rate tariff or to show how much your community is spending on their energy use if you already have a time-of-use tariff in place.

Below is an example of how to set a tariff that has a cheaper night rate compared to the day rate (like an Economy 7 tariff). The tariff is called the “Saver Tariff” and has a day rate of 16p/kWh from 8am to 8pm and a night rate of 5p/kWh from 8pm to 8am.

- Go to the “Tariff Configuration” tab
- Add a new tariff – here we’ve decided to call it the “Saver Tariff”. Once you’ve added it, you can select it to start configuring.

### Add Tariff Rate

Cost (p/kWh)	Start Time	End Time	Days
16	08:00	20:00	<input checked="" type="checkbox"/> M <input checked="" type="checkbox"/> T <input checked="" type="checkbox"/> W <input checked="" type="checkbox"/> T <input checked="" type="checkbox"/> F <input checked="" type="checkbox"/> S <input checked="" type="checkbox"/> S

- Start by adding your different unit rates for your tariff. Set your day/night rate by inputting a cost in p/kWh, choosing a start and end time, and selecting what days in the week this rate will apply to. You will have to set your different rates separately – once you are happy with your rate, you can click “Add”. *The above screenshot shows the day rate of 16p/kWh from 8am to 8pm.*

### Add Tariff Rate

Cost (p/kWh)	Start Time	End Time	Days
5	20:00	00:00	<input checked="" type="checkbox"/> M <input checked="" type="checkbox"/> T <input checked="" type="checkbox"/> W <input checked="" type="checkbox"/> T <input checked="" type="checkbox"/> F <input checked="" type="checkbox"/> S <input checked="" type="checkbox"/> S

*The screenshots above show the cheaper night rate of 5p/kWh between 8pm and 8am. It is important to note that you can only set rates in ranges for a day that span from midnight to midnight. In other words, if you wanted a cheap night rate to run from 8pm to 8am, you would have to set it as two rates: 20:00-00:00, 00:00-08:00. It would not work to set it from 20:00-08:00*

- You can also set your standing charge. Here, we’ve set it at 10 p/day

**Add Tariff Rate**

Cost (p/KWh)      Start Time      End Time      Days

     00:00      00:00       M  T  W  T  F  S  S

Set Standing Charge:

p/day

- Once all of your different rates have been set and added, your final tariff is displayed like this:

**Tariff Details**

Cost (p/KWh)	Start Time	End Time	Days	
5.00000	00:00	08:00	Mon Tue Wed Thu Fri Sat Sun	<input type="button" value="Delete Rate"/>
16.00000	08:00	20:00	Mon Tue Wed Thu Fri Sat Sun	<input type="button" value="Delete Rate"/>
5.00000	20:00	00:00	Mon Tue Wed Thu Fri Sat Sun	<input type="button" value="Delete Rate"/>

*NOTE: The above figures for unit rates and standing charge have been arbitrarily chosen, and are completely hypothetical.*

**AGILE OCTOPUS TARIFF**

All groups now have an automatically updated tariff called “Agile Octopus Feb 2018” based off a flexible time-of-use tariff supplied by Octopus Energy. The rates for this tariff are per ½ hour and change every day. By modelling how much a community’s energy use would cost according to this tariff, this function will be useful to start conversations around the benefits and costs savings to be made if signed up to this kind of flexible time of use tariff.

Once you’ve selected this tariff, a lot of different unit rates will appear in the Tariff Details:

**Tariff Details**

Cost (p/KWh)	Start Time	End Time	Days	
7.53900	00:00	00:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.05600	00:30	01:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.47600	01:00	01:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.47600	01:30	02:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.03500	02:00	02:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
6.13200	02:30	03:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.01400	03:00	03:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
5.91150	03:30	04:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
6.53100	04:00	04:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate

7.09800	05:30	06:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
6.61500	06:00	06:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
6.15300	06:30	07:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
5.73300	07:00	07:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
5.73300	07:30	08:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
6.91950	08:00	08:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.63350	08:30	09:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
7.83300	09:00	09:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
8.37900	09:30	10:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
8.46300	10:00	10:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
8.15850	10:30	11:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
9.26100	11:00	11:30	Mon Tue Wed Thu Fri Sat Sun	Delete Rate
9.26100	11:30	12:00	Mon Tue Wed Thu Fri Sat Sun	Delete Rate

**NOTE:** The rates displayed when the tariff is viewed are in general for the 12 hours before and 12 hours after the current time. The exception to this are the rates between 11pm and 4am, these are not updated until around 4pm, when the wholesale electricity rate data for the next day (using Central European Time, hence 11pm) is published.

## Data amalgamation

This function allows you to combine multiple values from different data sources into one single data source through setting up simple equations. This new amalgamated data source can then be displayed on graphs through the configuration tab and can be used when configuring alerts. There are a number of uses for this including:

- Displaying the total local generation
- Converting a data set into a different unit, for example kW
- Combine data sources from different feeders
- Estimating solar PV output based on a reference solar PV array.

### HOW TO CREATE AN AMALGAMATED DATA SOURCE

- Enter a name for the amalgamated data source. This name will appear on graphs and charts containing the amalgamated data.
- Select the standard data source category and sub-category values for up to 5 data sources. These are each allocated a data source letter, A – E.
- Enter an equation using the data source letters and mathematical symbols: add: +, subtract: -, multiply: \*, divide: /, brackets: ( ) and constant values, e.g.: 52.5. There is also a special data source letter, “H”, which corresponds to the hour of the day to the nearest 1/2 hour.
- Click on “Create” to create the amalgamated source. It will then appear under the data category “Amalgamation” and be available when creating graphs, alerts and further amalgamations.

#### Create an Amalgamated Data Source

Amalgamated Data Source Name	Select Data Sources		
	Data Letter	Data Category	Data Sub-Category
<input type="text"/>	A	Not required	Not required
	B	Not required	Not required
	C	Not required	Not required
	D	Not required	Not required
	E	Not required	Not required

Equation to amalgamate values:

**EXAMPLES**

CONVERT “ENERGY, ACTIVE (WH) (AVERAGE)” FOR THE COMMUNITY GROUP TO KWH.

This means dividing the community group total average active energy use by 1000 to convert Wh to KWh:

- Enter a name, e.g. “Group Active Energy (kWh)”
- Next to “A”, select “Energy, Active (Wh) (average)” and “Community Group (Total)”
- Enter the equation: “A/1000” i.e. divide the Wh value by 1000 to get kWh
- Click on create

*Create an Amalgamated Data Source*

Amalgamated Data Source Name	Select Data Sources		
	Data Letter	Data Category	Data Sub-Category
Group Active Energy (kWh)	A	Energy, Active (Wh) (average)	Community Group (Total)
	B	Not required	Not required
	C	Not required	Not required
	D	Not required	Not required
	E	Not required	Not required

Equation to amalgamate values:

**Create**

**TOTAL LOCAL GENERATION**

This is the sum of all the local generation sources.

- Enter a name, e.g. “Total Local Generation (kWh)”
- Select the local generation sources next to “A”, “B”, “C” etc. Note, if there are more than 5 local sources, multiple sub-amalgamations can be created and then these can be summed.
- Enter an equation, e.g.: A+B+C+D+E
- Click on create

*Create an Amalgamated Data Source*

Amalgamated Data Source Name	Select Data Sources		
	Data Letter	Data Category	Data Sub-Category
Total Local Generation (kWh)	A	PV Array (KWh)	Church PV
	B	PV Array (NREL estimate) (KWh)	Hay St, Bell Sq + Fairfield
	C	PV Array (NREL estimate) (KWh)	St Marins Lane, High St + Almshouses + St Martin
	D	Not required	Not required
	E	Not required	Not required

Equation to amalgamate values:

**Create**

**GET ENERGY USED, INCLUDING FROM LOCAL GENERATION**

This is the sum of the total active energy measured at the substation and the energy generated by local systems (e.g. PV). Values for all the local systems are needed.

- Enter a name, e.g. “Total energy consumption (kWh)”
- Next to “A”, select “Energy, Active (Wh) (average)” and “Community Group (Total)”; Next to “B”, select the data source for the energy generated by local systems (this will probably need to be created by amalgamating all the local systems, see above).
- Enter an equation, e.g.:  $(A/1000)+B$

**Create an Amalgamated Data Source**

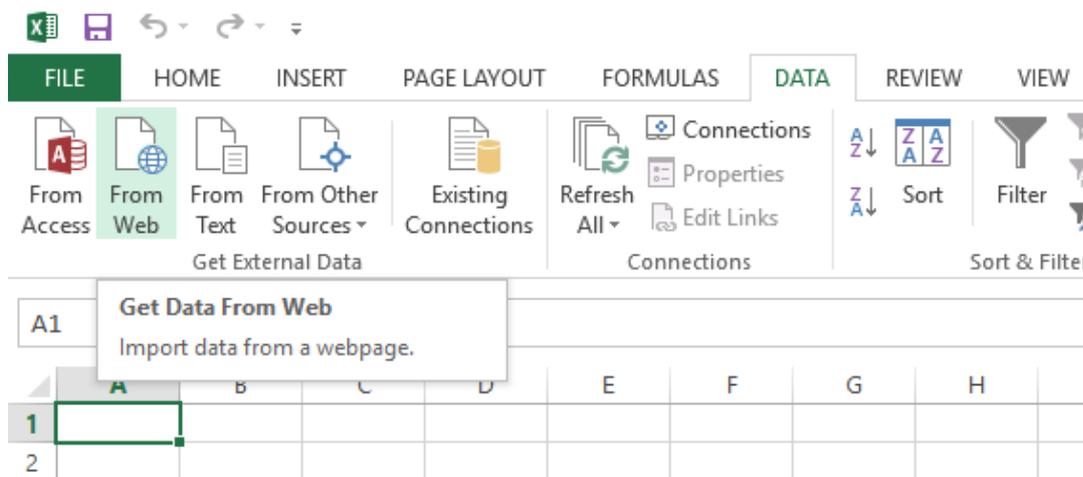

Amalgamated Data Source Name	Select Data Sources		
	Data Letter	Data Category	Data Sub-Category
Total energy consumption (kWh)	A	Energy, Active (Wh) (average)	Community Group (Total)
	B	PV Array (KWh)	Church PV
	C	Not required	Not required
	D	Not required	Not required
	E	Not required	Not required

Equation to amalgamate values:

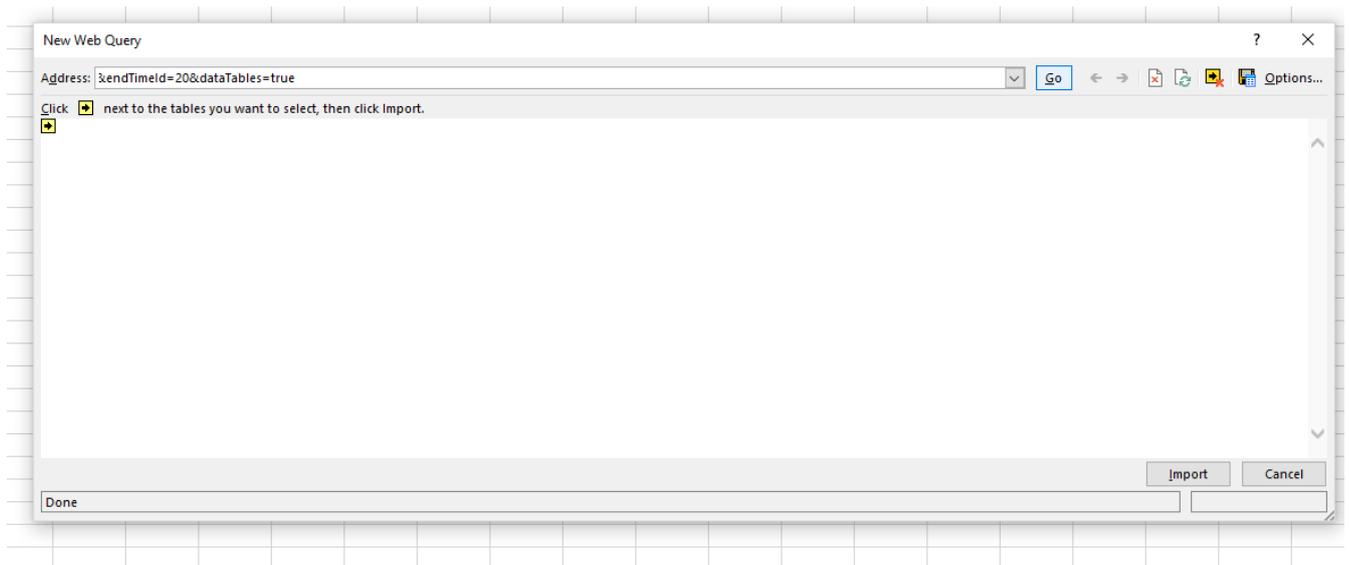

## Analysing data in Excel

If you want to extract data from the web app to analyse, you can do this easily through Excel.

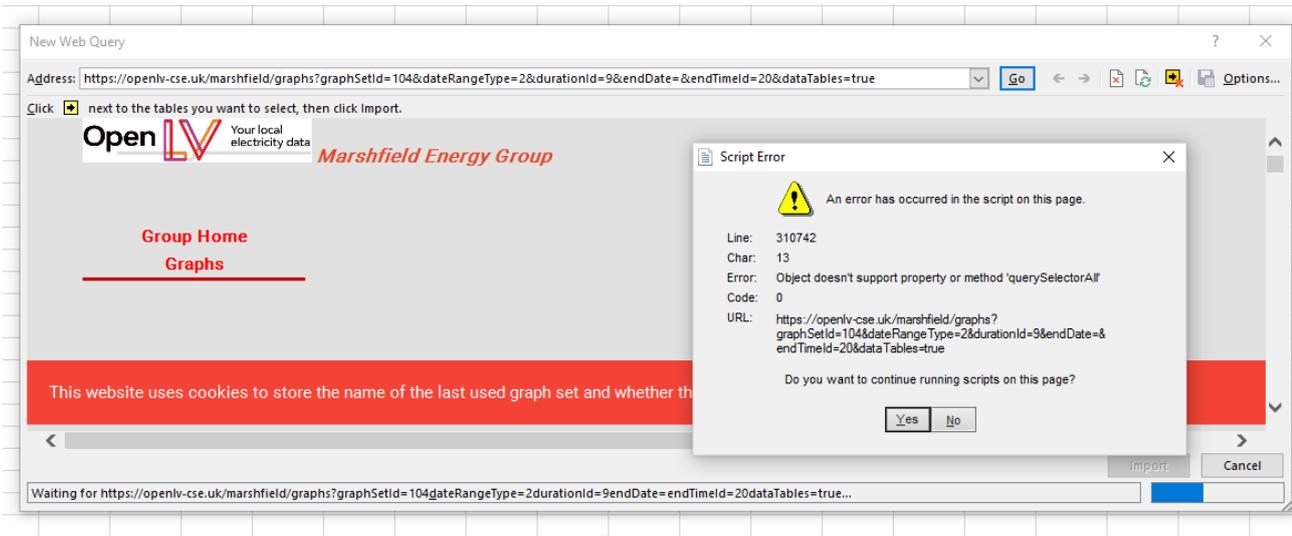

- Firstly you will need to create a graph and display it using the Graph Display tab. *NOTE: You must remember to tick the box “Display data in tables” for this to work.*
- Once you’ve created and displayed a data set, you will need to copy the URL link.
- Once you’ve done this, open Microsoft Excel. On the tab called “DATA” at the top, select “From Web”:

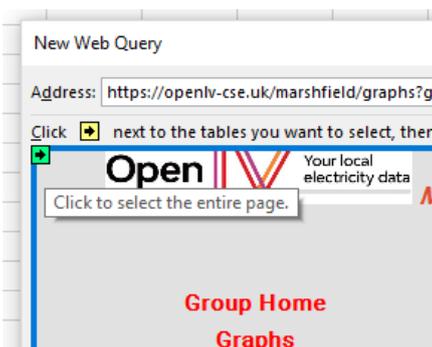

- A box will appear where you have to paste in the URL (in the box called “Address”). Then click “Go”.

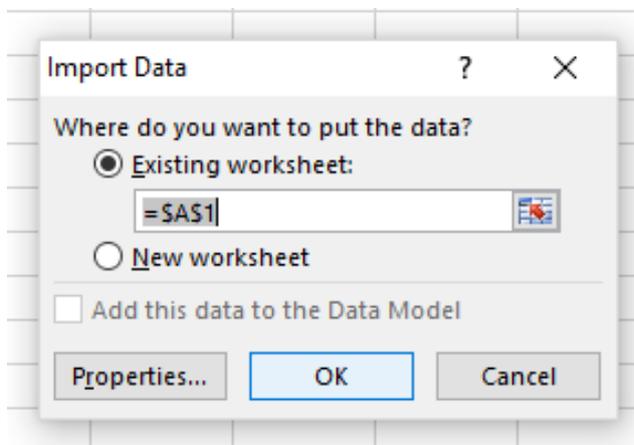

- A series of “Script Error” messages will appear – Click “Yes” on ALL of them.

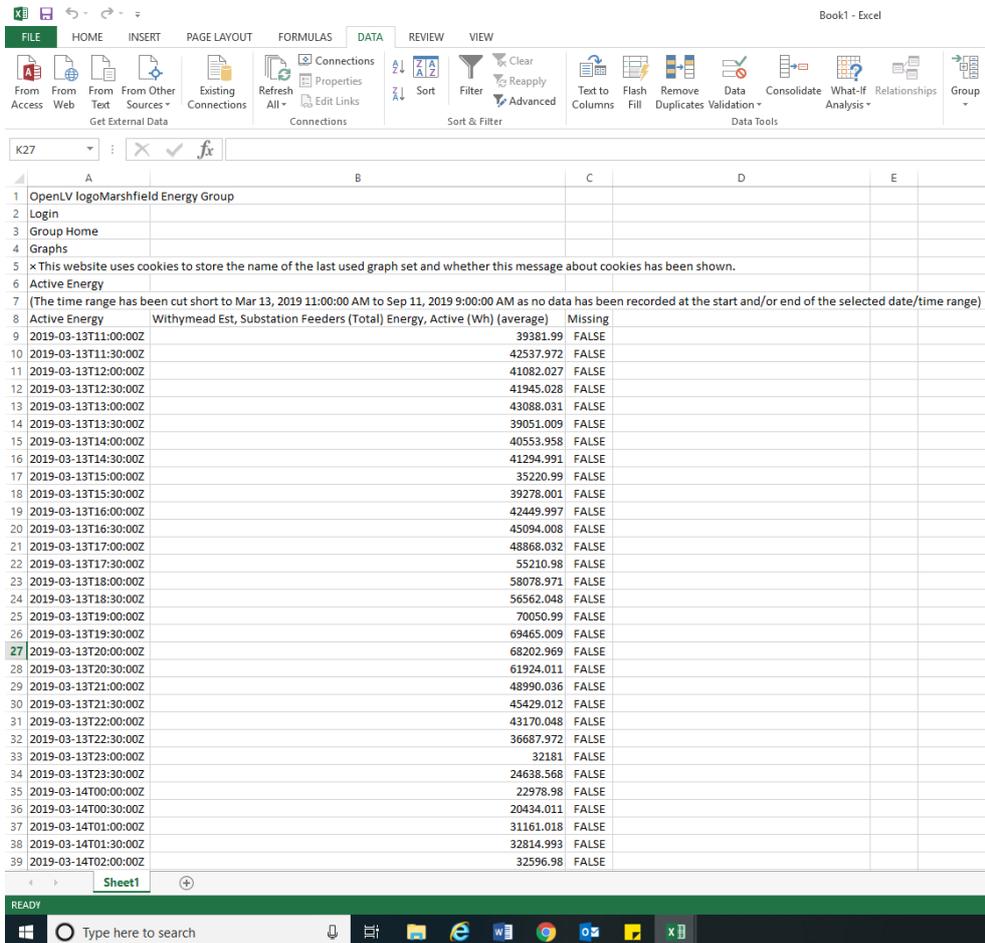

- Once you’ve clicked “Yes” on all the “Script Error” messages, you will need to click on the small arrow on the top left of the box (highlighted in green in the image below).

- Click “Import” on the bottom right of the box.
- The box below will appear – click “OK”

- Your data will then appear in the spreadsheet. You can then use this data to create your own graphs and run your own analysis.

**NOTE:** This will probably not work for massive data sets. For example, 1 years' worth of data from the whole substation (if the substation has many feeders).

## Using the API to access data

### API NOTES

- The API allows users to access 30 minute data from the app for manipulation outside, or alongside, use of the graphs and other functions in the web app
- Time periods in a given day can be set by the user, but for multiple days you will need to run multiple queries.
- You will need to have a basic understanding of JSON to be able to extract data using this guidance but there are various programmes online which you can use to convert JSON output from this API into CSV files, SQL, and other formats.
- The guidance below shows how to create a string which you can enter as a URL into a web browser to return a full set of OpenLV (method 2 community trials) data for a given period

### THE “READINGS” INTERFACE

#### Query

The RESTful api allows GET on

```
https://{server}/{groupShortName}/api/readings?
    password={password}&
    startTime={startTime}&
    endTime={endTime}
```

The arguments are:

**server** = openlv-cse.uk (live) or olv-cse-qa.co.uk (QA)

**groupShortName** = groups' short name as used in the main website, *marshfield, bwce, rooftop, whg, ece, owensquare* or *tec*.

**password** = The groups' password

**startTime** = UTC time for required start date & time, using the usual format: YYYY-MM-DDThh:mm:ssZ (see the example below), where

YYYY = 4 digit year

MM = 2 digit month 01 to 12

DD = 2 digit day of month 01 to 31

hh = 2 digit hour 00 to 23

mm = 2 digit minute 00 to 59 (note data is available at 00 and 30)

ss = 2 digit second 00 to 59 (note data is available at 00)

**endTime** = UTC time for required end date & time (same format as startTime)

Example:

```
https://olv-cse-qa.co.uk/marshfield/api/readings?password=****&startTime=2018-10-24T00:00:00Z&endTime=2018-10-24T03:00:00Z
```

## Response

The response is a JSON string with the following top level format.

```
{
  "startTime": "2018-10-24T00:00:00Z",
  "status": "OK",
  "readings": []
}
```

**startTime:** This gives the starting time for the readings contained in the readings array. The first reading will be at this time. The next reading will be 30 minutes later and so on until all the readings are exhausted.

**status:** This contains a descriptive code for the query. Values are:

**OK** (HTTP Status – OK): Success

**BUSY** (HTTP Status – SERVICE\_UNAVAILABLE): Try again later. This may happen while readings are being updated.

**TRUNCATED\_DURATION** (HTTP Status – OK): The duration requested was too long and has been truncated. The max is set at 1 day.

**BAD\_REQUEST** (HTTP Status – BAD\_REQUEST): Non-specific issue with the request

**BAD\_DATETIME** (HTTP Status – BAD\_REQUEST): Failed to parse the date and/or time information

**BAD\_PASSWORD** (HTTP Status – UNAUTHORIZED): Incorrect password used

**BAD\_GROUPNAME** (HTTP Status – BAD\_REQUEST): Invalid group name used (must be from the list above).

**readings:** This is where the actual reading data is contained. There is one entry for each sensor / data source. All sensor data for the community group is included. These have the format:

```
{
  "id": 1345,
  "description": "Community Group Total Carbon Intensity (gCO2)",
  "halfHourlyValues": []
}
```

**id:** This is a unique and fixed id for the sensor / data source (which can be a total value based on a set of data sources).

**description:** This is a human readable description for the data source which matches the description used in the web interface.

**halfHourlyValues:** This is where the actual readings are contained. Here is an example:

```
"halfHourlyValues": [  
  871.07880000000002,  
  818.51234,  
  931.16664,  
  "NaN",  
  902.43463000000001,  
  882.69382999999999  
]
```

The first entry is the reading for the time in the `startTime` field (see above), then each further value is for 30 minutes later. Gaps in the data, due to missing readings, are filled using “NaN”. Missing readings at the end of the duration are not output, meaning the arrays for different sensors can be different lengths.

## Embedding graphs using i-frames

### UNDECORATED GRAPH NOTES

- There is a page for use in iframes, it has the same parameters as “graphs” but is called “graphsundecorated”.
- The “graphsundecorated” page can be added to an iframe tag on any website:

```
<!DOCTYPE html>
<html>
  <head>
    <title>iframe test</title>
  </head>
  <body>
    <iframe
      height="400" width="800"
      src="https://openlv-cse.uk/marshfield/graphsundecorated?{args}>
    </iframe>
  </body>
</html>
```

- This page has no “x-frame-options” setting. All other pages have an “x-frame-options” setting of DENY.
- The arguments to the “graphsundecorated” page are the same as to the “graphs” page, so, to show some graphs within an iframe on a 3rd party website, find the required arguments using the webapp and the “graphs” page, then copy and use with the above page.

### EXAMPLES:

*For times up to the request time (dateRangeType 2):*

<https://openlv-cse.uk/whg/graphs?graphSetId=41&dateRangeType=2&durationId=6&endDate=&endTimeId=27>

becomes:

<https://openlv-cse.uk/whg/graphsundecorated?graphSetId=41&dateRangeType=2&durationId=6&endDate=&endTimeId=27>

*or, for dateRangeType 1, with a date:*

<https://openlv-cse.uk/whg/graphs?graphSetId=41&dateRangeType=1&durationId=8&endDate=2018-11-07&endTimeId=18>

becomes:

<https://openlv-cse.uk/whg/graphsundecorated?graphSetId=41&dateRangeType=1&durationId=8&endDate=2018-11-07&endTimeId=18>

Note: The auto-refresh for “dateRangeType 2” mode is disabled for the graphsundecorated page. However, the data displayed will be updated when the page is reloaded.

Full example (using QA server):

```
<!DOCTYPE html>
<html>
  <head>
    <title>iframe test</title>
  </head>
  <body>
    <iframe
      height="400" width="800"
      src="https://olv-cse-qa.co.uk/whg/graphsundecorated?
graphSetId=27&dateRangeType=1&durationId=8&endDate=2018-11-05&endTimeId=24">
    </iframe>
  </body>
</html>
```

## Displaying data from solar PV array

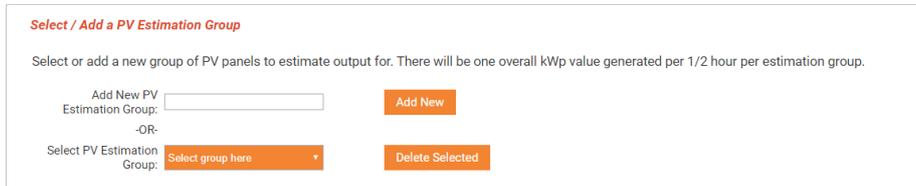

### ESTIMATING SOLAR PV OUTPUT

We are able to estimate the solar output of any PV arrays you have using the NREL “pvwatts” service see: <https://developer.nrel.gov/docs/solar/pvwatts/v6/> & <https://www.nrel.gov/docs/fy14osti/62641.pdf>. Configuration for panels to be estimated needs to be added per community group. Outputs can be grouped together e.g. by the feeder the PVs are connected to.

If you would like to estimate PV output, you will need to use the “PV Estimation” function (see below). This function allows you to manually input the details of any solar PV installations in your community and use the app to estimate the PV output.

- To create a new PV Estimation group you will need to use the first box on the page. Here you can also edit any that you’ve previously used. Here you can chose how you will group your PV outputs by creating an appropriate name (for example if you are estimating the PV outputs of all PV panels on a feeder, use the same name as you’ve chosen for the feeder).

- Once you’ve created a new PV Estimation Group, you’ll need to “select” it to edit the group.

- Once you’ve selected your PV Estimation group, you can start adding the solar installations to be estimated in the box at the bottom of the page (see below). To do this you will need to input the following information:

- System size (kW) or simply the number of panels (we will estimate the system size using 280w per panel)
- Tilt angle (°) (angle from horizontal)
- Azimuth angle (°) (angle from North)

*Add a PV installation to the selected PV Estimation Group*

Enter the values below for the additional installation and click “Add”.

Tilt	Azimuth	Power	
<input type="text"/>	<input type="text"/>	<input type="text"/>	kWp <input type="button" value="Add"/>

- Once you've added an installation, this will appear in the box "Existing PV installations in the selected PV Estimation Group" (see below)

**Existing PV installations in the selected PV Estimation Group**

Tilt	Azimuth	Power	
32.0°	180.0°	10.64 kWp	<a href="#">Remove</a>

**IMPROVED ESTIMATES FUNCTION – FOR GROUPS WITH ACTUAL SOLAR PV DATA INTERGRATED INTO THE WEB APP!**

A new function allows groups to improve the modelled estimates by comparing it with actual solar data (if this is already integrated in the app through an API). This works by calculating the error between the actual solar array output and its estimated version, and using this error to correct the estimate of another PV Estimation group that you've added.

*NOTE: You can only use this function if you have a local solar PV installation which we have integrated into the web app through an API to display output.*

- On the PV Estimation page there is a box called "Set Reference Actual PV and Estimated PV Data Sources for the Selected Group". To create the reference, you'll need to select an "Actual PV data source" and an "Estimated PV data source". In the example below which comes from Marshfield, we are using the Church PV as the actual data source.
- To create the "Estimated PV data source", you MUST add an estimated version of the actual PV data source (in this example, an estimated version of the Church PV data). You do this by creating a new estimation group as shown previously. Once you've created this group, you can select it in the "Estimated PV data source" drop down list.

**Set Reference Actual PV and Estimated PV Data Sources for the Selected Group**

The accuracy of estimated PV data can be improved using a reference PV array for which actual PV data and estimated PV data is available. If only actual PV data is available for a PV array to be used as a reference, first use this form to create a new group to provide an estimate for this PV array.

Select the actual and estimated PV data sources of the reference PV array to be used with the selected group below, then click the "Update" button.

Actual PV data source: Church PV ▾

Estimated PV data source: Church PV (Estimate) ▾ [Update](#)

- Once you've selected both data sources, click "Update".

## DISPLAYING ACTUAL AND ESTIMATED SOLAR PV OUTPUT

On the Graph Configuration page, you can set up graphs to display your actual PV outputs (if you have this integrated on the app – ie SolarEdge installations), your estimated outputs for a PV installation and your improved estimates.

### DISPLAYING ACTUAL SOLAR DATA (FROM SOLAREEDGE INSTALLATIONS)

For groups who have a local PV array installed by SolarEdge, we were able to access an API that allows real data collected from SolarEdge PV installations to be displayed. The display is based on the 15 min watts output values. These are converted to KWh and summed over 30 min periods to match the other data measurements.

Please contact CSE for details of the information you need to provide to allow CSE to configure the system to access your SolarEdge data.

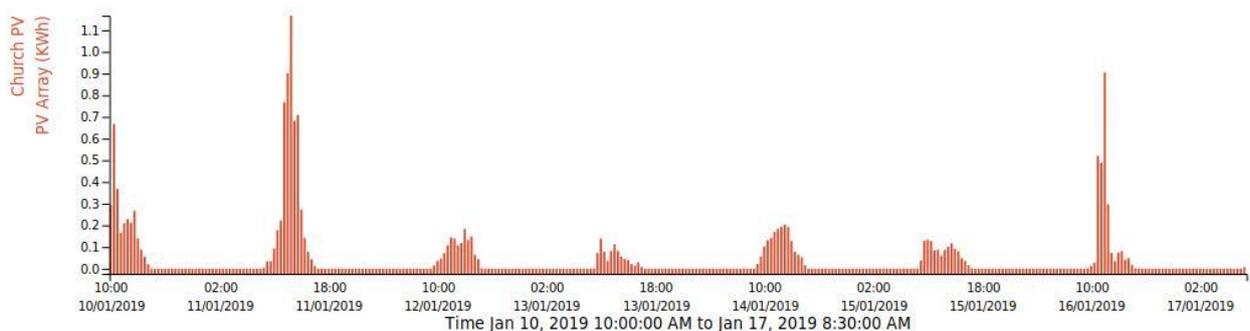

To configure a graph using the solar data from your SolarEdge PV installation, see screenshot below:

#### Add Graphs to Graph Set

Enter Graph Name	Select Graph Type	Select Data Sources												
PV array	Bar Chart	<table border="1"> <thead> <tr> <th></th> <th>Data Category</th> <th>Data Sub-Category</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PV Array (KWh)</td> <td>Church PV</td> </tr> <tr> <td>2</td> <td>Not required</td> <td>Not required</td> </tr> <tr> <td>3</td> <td>Not required</td> <td>Not required</td> </tr> </tbody> </table>		Data Category	Data Sub-Category	1	PV Array (KWh)	Church PV	2	Not required	Not required	3	Not required	Not required
			Data Category	Data Sub-Category										
		1	PV Array (KWh)	Church PV										
2	Not required	Not required												
3	Not required	Not required												
<b>Add</b>														

#### PV array

(The time range has been cut short to Jan 10, 2019 10:00:00 AM to Jan 17, 2019 8:30:00 AM as no data has been recorded at the start and/or end of the selected date/time range)

**NOTE: If you have a SolarEdge installation, select the “PV Array (KWh)” Data Category.**

**DISPLAYING ESTIMATED SOLAR DATA (NREL ESTIMATE)**

Once you've added your Estimated PV group using the PV Estimation function, you will be able to configure a graph using this solar PV estimated output as in the screenshot below:

**Select / Add a Graph Set**

Add New Graph Set:  Add New

-OR-

Select Graph Set: Hay St, Bell Sq + Fairfield PV Delete Selected

---

**Add Graphs to Graph Set**

Enter Graph Name	Select Graph Type	Select Data Sources	
		Data Category	Data Sub-Category
Hay St, Bell Sq + Fairfield PV Es	Bar Chart	1 <span style="float: right; border: 1px solid #ccc; padding: 2px 10px;">Add</span>	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">PV Array (NREL estimate) (KWh)</span> <span style="float: right; border: 1px solid #ccc; padding: 2px 10px;">Hay St, Bell Sq + Fairfield</span>
		2	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">Not required</span> <span style="float: right; border: 1px solid #ccc; padding: 2px 10px;">Not required</span>
		3	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">Not required</span> <span style="float: right; border: 1px solid #ccc; padding: 2px 10px;">Not required</span>
		4	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">Not required</span> <span style="float: right; border: 1px solid #ccc; padding: 2px 10px;">Not required</span>
		5	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">Not required</span> <span style="float: right; border: 1px solid #ccc; padding: 2px 10px;">Not required</span>

---

**Existing Graphs**

Graph Name	Graph Type	Data Sources	Remove
		Data Category	Data Sub-Category
Hay St, Bell Sq + Fairfield PV Estimate	Bar Chart	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">PV Array (NREL estimate) (KWh)</span> <span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">Hay St, Bell Sq + Fairfield</span>	<span style="border: 1px solid #ccc; padding: 2px 10px; background-color: #f96;">Remove</span>

---

**Hay St, Bell Sq + Fairfield PV Estimate**  
 (The time range has been cut short to Aug 28, 2019 4:00:00 PM to Sep 4, 2019 3:00:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

Time Aug 28, 2019 4:00:00 PM to Sep 4, 2019 3:00:00 PM

DISPLAYING ESTIMATED SOLAR DATA (IMPROVED ESTIMATE)

If you've used a reference PV data source to improve the accuracy of your estimated solar output, then you can configure a graph with this improved estimate. The below graph configuration set up and graph shows how to do this (graph set has both the NREL estimate AND the improved estimate):

Select / Add a Graph Set

Add New Graph Set:  Add New

-OR-

Select Graph Set: Hay St, Bell Sq + Fairfield PV Delete Selected

Add Graphs to Graph Set

Enter Graph Name	Select Graph Type	Select Data Sources	
Hay St, Bell Sq + Fairfield PV Es	Bar Chart	<b>Data Category</b>	<b>Data Sub-Category</b>
		1 PV Array (NREL estimate) (KWh)	Hay St, Bell Sq + Fairfield
		2 PV Array (estimate + ref.) (kWh)	Hay St, Bell Sq + Fairfield
		3 Not required	Not required
		4 Not required	Not required
		5 Not required	Not required

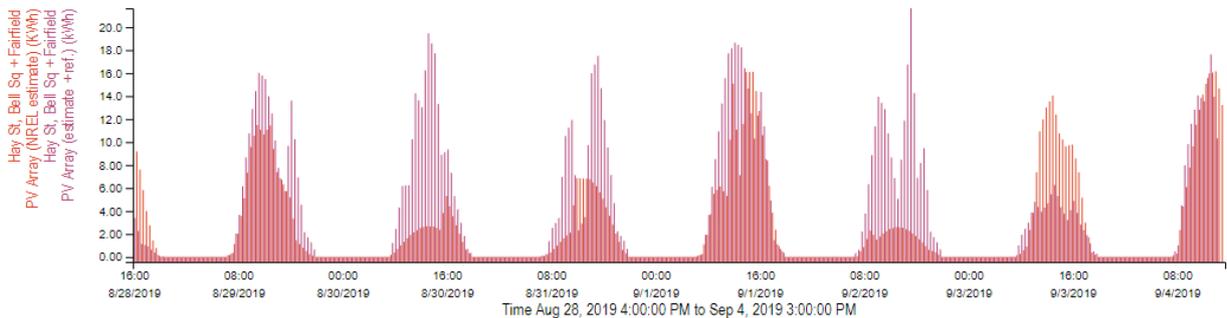

Add

Existing Graphs

Graph Name	Graph Type	Data Sources	Remove						
Hay St, Bell Sq + Fairfield PV Estimate (improved)	Bar Chart	<table border="1"> <thead> <tr> <th>Data Category</th> <th>Data Sub-Category</th> </tr> </thead> <tbody> <tr> <td>PV Array (NREL estimate) (KWh)</td> <td>Hay St, Bell Sq + Fairfield</td> </tr> <tr> <td>PV Array (estimate + ref.) PV Array (NREL estimate) (KWh)	Hay St, Bell Sq + Fairfield								
PV Array (estimate + ref.) (kWh)	Hay St, Bell Sq + Fairfield								

Hay St, Bell Sq + Fairfield PV Estimate (improved)

(The time range has been cut short to Aug 28, 2019 4:00:00 PM to Sep 4, 2019 3:00:00 PM as no data has been recorded at the start and/or end of the selected date/time range)

## Data sources, calculations and assumptions

This link takes you to a document which lists the data being recorded within the LV-CAP units:

<https://openlv.net/wp-content/uploads/2017/10/OpenLV-Measurement-Points-V1.0.pdf>

In addition to this data, the Method 2 web app also draws on several sources of external data, including carbon intensity data, solar and wind data (from specific renewable energy installations in several of the communities taking part in the trials, imported via FTP and APIs), and estimated solar data which uses an external solar PV calculator.

### Carbon intensity data

In the web app you can generate graphs and smileys which show the carbon emissions associated with the energy mix being used to generate electricity at a given time of day. It uses an API which converts a postcode into a region of the UK, then returns an estimated intensity (named 'forecast' in the response) for the region of the UK and the from/to times specified. The "actual" values are not available from the app developers - the actual values are only available on a UK wide level.

This is the API: <https://api.carbonintensity.org.uk/regional/intensity/{from}/{to}/postcode/{postcode}>

The methodology is documented here:

<https://carbon-intensity.github.io/api-definitions/?shell#get-regional-intensity-from-to-postcode-postcode>

### Locally generated electricity data

Some of the communities in the Method 2 trials have renewable energy assets which are generating electricity from wind or solar PV arrays which have data loggers. The app can use an FTP system, or the API provided by SolarEdge, to visualise data alongside the substation data, and provides a way of comparing energy generation with energy demand.

### Timestamps

The OpenLV Platform uses Co-ordinated Universal Time (UTC) web app, so the timestamps for the 1-min data downloads from the LV-CAP units may be different (by one hour) during the Daylight Saving Time (DST) period (i.e. British Summer Time). However, the web app corrects this and uses British Summer Time during the DST period. So if you use the web app for 'real time' data, it will be the actual time, and not an hour out. However, the API uses UTC time as described above.

### Inside temperature readings

In some substations the LV-CAP unit is attached outside the substation, which means that there will never be an inside temperature reading. If this is the case, and you have set up a graph to show the inside temperature, the data will not display (because there is no data). This is the case for the following substations in the trials:

079 – Bloomfield Ave

069 – West Littleton Rd

043 – Withymead Estate

044 – Hay St.

066 – Harpfield Close

070 – St. Martins Lane

### **Octopus Energy’s “Agile Octopus” time of use tariff**

Octopus Energy’s “Agile Octopus” tariff rates have been integrated into the web app. A function will be developed that will query these rates at the start of each day and update a new OpenLV “Agile Octopus” tariff entry for each of the community groups.

For more information about this innovative flexible time of use tariff: <https://octopus.energy/agile/>

## **More information about the OpenLV project**

For more information about the OpenLV project, visit: <https://openlv.net/about/>

For more information about the OpenLV web app and how to use it, email:

[OpenLV@cse.org.uk](mailto:OpenLV@cse.org.uk)

or

[Communities@cse.org.uk](mailto:Communities@cse.org.uk)
