

August 2021

Serving the Midlands, South West and Wales

Foreword

With the Government's commitment to end the UK's contribution to carbon emissions by 2050, and the announcement of a ten point plan for a green industrial revolution, the role of electricity in helping to facilitate Net Zero is becoming increasingly important. As our customers shift to electrify their heating and transport needs, our network will need to be smarter and more flexible than ever.

At Western Power Distribution we have a strong track record of delivering best in class service and as we take a more active role in managing the electricity distribution system, we will continue to develop our business and remain at the forefront of Distribution Systems Operations.

Building on our strong background of planning and operating networks, we have been opening opportunities for distributed energy resources to help support our network. Developing successful markets also requires confidence in those opportunities continuing in the future and the market needs to have transparency in the process and outcomes of our decision making.

Building on other WPD publications improving transparency, this Distribution Network Options Assessment (DNOA) outlines the decisions made to meet the future needs of the distribution network in the Midlands, South Wales and the South West over the next few years.

By providing more information to the growing distribution flexibility market about current and future network requirements across our region, we can help flexibility providers identify the opportunities to support the electricity system and bring forward investment in green technologies.

A smarter network needs smarter decisions: this DNOA outlines the options considered to provide the best consumer value in investments made on the distribution network.

The DNOA methodology describes how investment decisions are informed by the Distribution Future Energy Scenarios (DFES), and how cost-benefit analysis is employed to determine the optimal investment path.

The decisions made within this DNOA will show how we are optimising our investment to deliver secure, sustainable and affordable electricity to meet the changing needs of the areas we serve.

We welcome any feedback that will help us to push the DNOA even further to drive value and benefit for our customers.

Ben Godfrey Distribution System Operator Manager

During 2020, the ENA's Open Networks developed and delivered a tool for all DNOs to use in evaluating future investment decisions. The Common Evaluation Methodology (CEM) tool uses financial, forecasting and technical network inputs to understand the costs involved across a number of different future outcomes. These can be compared to choose the optimal investment pathway and, most importantly, can provide a transparent rationale for choosing that pathway.

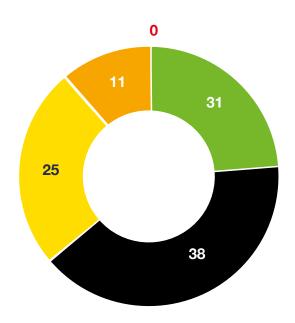

Below is a summary of the investment decisions reached across the 4 licence areas. 105 schemes were assessed; split between 42 in the East Midlands, 20 in the West Midlands, 11 in South Wales and 32 in the South West.

This DNOA assesses potential reinforcement schemes with a combined cost of over £273m. The total cost of flexibility procurement over the 5 year period considered in this DNOA is predicted to be £10m. Flexibility indicates a decision to procure flexibility or to maintain the flexibility contracts currently in place to defer reinforcement.

Reinforce indicates a decision to pursue traditional network reinforcement immediately. Reinforce with flexibility is when reinforcement is set to begin immediately, but flexibility is required to deal with the constraint in the interim.

Signposting signals a decision to inform potential providers of future flexibility requirements whilst the need requirement is monitored. Remove signals a decision to remove the scheme from consideration in future DNOAs. All schemes will be re-assessed in future DNOAs until there is no option value left to realise.

Proposed Scheme Closure

The year when a constraint no longer requires intervention, after which the scheme is removed from future DNOAs.

Flexibility Start Year

The first year that flexibility is required to address a constraint, under WPD Best View and the other DFES scenarios.

DNOA Decision

The outcome recommended by this iteration of the DNOA to manage each constraint most economically. These different possible outcomes are described above.

How to use this document

The DNOA explains the methodology, information used and outcome for the investment decisions on our network. Reinforcement and flexibility both have a part to play in the efficient and economic development of the distribution system. This DNOA has both forwards looking and backwards looking elements when considering flexibility.

Looking backwards

Looking backwards identifies the proposed scheme closure dates based on the DNOA decision and the outcome of flexibility tenders. A proposed scheme closure date earlier than the CBA forecasts occurs where flexibility is not available.

Looking forwards

Looking forwards identifies the proposed intervention technique using

Table 1: Summary of investment decisions in the East Midlands

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Wigston	Wigston 132/33kV BSP and 132/11kV PSS group demand almost requires a P2 N-2 restoration requirement.	2025+	2025	2024 - 2025+	Signposting
Bradwell Abbey - Newport	Loss of the BA - NP/Hanslope Park circuit results in the Newport Pagnell demand and half the Fox Milne demand being supplied by the other 33kV circuit.	2025+	2025+	2025+	Signposting
Milton Keynes East	Load exceeds transformer rating at Milton Keynes East BSP.	2025+	2025+	2025+	Signposting
Ashby	Gresley-Moira 33kV circuit are close to their firm capacity.	2025+	2023	2022 - 2025+	Signposting
Woodhall Spa	Woodall Spa PSS was exceeding the N-1 firm capacity which was limited by 11kV backfeeds.	2020	2021	2021	Flexibility
Lincoln - North Hykeham	Lincoln - North Hykeham 33kV circuit is currently overcommitted with demand.	2021	2021	2021	Reinforce with flexibility
Lincoln - Beevor Street	Lincoln - Beevor Street 33kV circuit is currently overcommitted with demand.	2021	2021	2021	Reinforce with flexibility
Mantle Lane	One of the 33kV circuits between Coalville BSP and Mantle Lane becomes overloaded for an N-1 circuit outage.	2021	2021	2021	Reinforce with flexibility
Apollo - Tamworth	Apollo 33/11kV PSS has limited capacity for an N-1 circuit outage.	2025+	2021	2021	Flexibility
Chesterfield Main	Chesterfield-Grassmoor 33kV circuits have limited capacity for an N-1 circuit outage.	2025+	2021	2021	Flexibility
Clowne	Insufficient backfeed and load growth exceeds rating of transformer at Clowne PSS.	2025+	2021	2021	Flexibility

Table 1: Summary of investment decisions in the East Midlands - Continued

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Coalville	Constraint at Coalville BSP on transformers due to new connection.	2023	2021	2021	Reinforce with flexibility
Grassmoor	Grassmoor 33/11kV PSS has limited capacity for an N-1 circuit outage due to new connection.	2023	2021	2021	Flexibility
Hinckley	Hinckley 132/11kV PSS is out of N-1 firm capacity due to new connection.	2024	2021	2021	Flexibility
Alfreton	Meadow Lane 33/11kV PSS is limited by N-1 firm capacity.	2023	2021	2021	Flexibility
Nailstone	Nailstone 33/11kV PSS now has limited N-1 capacity due to new connection.	2022	2021	2021	Reinforce with flexibility
Tamworth Main	Tamworth 33/11kV PSS is running out of N-1 firm capacity due to new connection.	2025+	2021	2021	Flexibility
Union Street - Rugby	Union Street 33/11kV PSS is limited by N-1 firm capacity.	2025+	2021	2021	Flexibility
Woodbeck	Woodbeck 33/11kV PSS is limited by 11kV backfeeds for an N-1 outage.	2025+	2021	2021	Flexibility
Weedon	Weedon 33/11kV PSS is limited by 11kV backfeeds for an N-1 outage.	2025+	2021	2021	Flexibility
Hawton	Hawton 132kV circuits limited by overhead line. Triggered by generation growth.	2025+	2021	2021	Flexibility
Lincoln - Anderson Lane	Increased demand on Lincoln-Anderson Lane-South Carlton 33kV circuit.	2022	2021	2021	Reinforce with flexibility
Crowland	Crowland 33/11kV PSS is expected to exceed its firm capacity.	2025+	2021	2021	Flexibility
Berkswell SGT	GSP compliance.	2023	2021	2021	Reinforce with flexibility
Loughborough	Combined demand at Loughborough 132/33kV BSP and 132/11kV PSS is forecast to exceed 100MW and become non-compliant under P2/7.	2023	2021	2021	Reinforce with flexibility
Mackworth	Voltage limiting firm capacity of Mackworth PSS due to lack of tap changer.	2025+	2021	2021	Flexibility
Manton	New Connections demand exceeds transformer capacity at Manton PSS.	2025+	2021	2021	Flexibility
New Dove Valley	Additional load cannot be accommodated at Hatton PSS.	2024	2021	2021	Flexibility

Table 1: Summary of investment decisions in the East Midlands - Continued

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Ilkeston	Capacity of the 33/11kV transformers at Ilkeston PSS projected to be exceeded under a FCO condition.	2024	2021	2021	Flexibility
Staythorpe	Three phase make fault level is 91.1% of rating and three phase break fault level is 106.2% of rating at Staythorpe B 132kV substation.	2024	-	-	Reinforce
Thurmaston	Three phase make fault level is 93.3% of rating on Thurmaston 11kV switchgear.	2022	-	-	Reinforce
Hawton- Bowbridge	26MVA over 22/19MVA circuit rating.	2022	-	-	Reinforce
Regent Street	Multiple site issues; transformer compound wall and canal bridge crumbling (canal bridge contains 11kV transformer tails).	2024	-	-	Reinforce
Staveley 33kV	Insufficient demand disconnection for LFT to meet Grid Code at Staveley BSP and Whitwell BSP.	2021	-	-	Reinforce
Willington	Fault level is likely to be overstressed (infrastructure rating unknown) for Willington 132kV.	2024	-	-	Reinforce
Newton Road	Three phase make fault level is 106% of rating on Newton Road 11kV switchgear.	-	-	-	Reinforce
Staveley 11kV	Three phase make fault level of Staveley 11kV switchgear is above 100% of rating after connection of Whittington STOR 11kV.	-	-	-	Reinforce
Nottingham North	Three phase make fault level is 99.7% of rating on Nottingham North 11kV switchgear.	-	-	-	Reinforce
Wolverton	Three phase make fault level is 102% of rating on Wolverton 11kV switchgear.	-	-	-	Reinforce
Long Eaton	Willington GSP compliance due to demand transfer.	2022			Reinforce
Walpole- Boston	Ability to provide the secure post fault transfer of Skegness BSP to Walpole GSP during SGT outages at Bicker Fen GSP.	2021	-	-	Reinforce
Rugby BSP	Fault level restriction on the switchboard at Rugby BSP.	2023	-	-	Reinforce

Table 2: Summary of investment decisions in the West Midlands

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Bushbury	Bushbury 132/11kV substation estimated to be 105% firm capacity within 3 years.	2025+	2025+	2024 - 2025+	Signposting
Madeley	Madeley PSS is forecast to exceed its firm capacity some time past 2025.	2025+	2025+	2025+	Signposting
Smethwick	Smethwick 132/11kV substation likely to overload when 1 of the 3 transformers is on outage.	2025+	2025+	2024 - 2025+	Signposting
Donnington	Load likely to exceed firm capacity of Donnington PSS.	2021	2021	2021	Reinforce with flexibility
Oldbury	Load growth will soon put Oldbury GSP out of P2/7 N-2 compliance.	2022	2021	2021	Reinforce with flexibility
Brimscombe	An outage on one of the Ryeford circuits during winter peak demand results in below statutory voltages at either Camp or Cherington. Dudbridge PSS is approaching firm capacity.	2025+	2021	2021	Flexibility
Meaford	33kV voltages drop to below 0.9 per unit in N-1 scenarios.	2022	2021	2021	Reinforce with flexibility
Hereford - Ledbury Ring	Low voltages at Ross on the 66 and 11kV bars for outage of Hereford - St Weonards - Ross. Exacerbated by new load at Ledbury.	2022	2021	2021	Reinforce with flexibility
Feckenham South	66kV voltage outside of limits at Bloxham and Epwell for fault condition outage of Stratford - Shipston circuit.	2022	2021	2021	Reinforce with flexibility
Hereford BSP	Hereford BSP (Walham) forecast to exceed its firm capacity.	2022	2021	2021	Reinforce with flexibility

Table 2: Summary of investment decisions in the West Midlands - Continued

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Eastern Avenue	High fault levels at 99 and 100% of rating on GT1 and GT2 at Eastern Avenue BSP.	2022	-	-	Reinforce
Warndon	Section X and Y of the 11kV switchgear at Warndon are marginally overstressed.	2021	-	-	Reinforce
Cheapside	Cheapside 11kV switchgear overstressed.	2023	-	-	Reinforce
Penn	Penn 132kV switchgear overstressed.	2022	-	-	Reinforce
Sankey	Circuit overloads after a first circuit outage (29.6MVA on a 27MVA rated conductor). Circuit is a cable (39MVA rating), bottleneck is a 17m overhead span (27MVA rating).	2021	-	-	Reinforce
Burslem	Split busbar arrangement at Cellarhead results in circuit overloads of the Cellarhead - Rugeley/Barlaston circuit during 2nd outage of the Cellarhead - Stagefields circuits.	2022	-	-	Reinforce
Wapley	Improve network security.	2021	-	-	Reinforce
Cellarhead	Under N-2 summer conditions multiple circuits overload with worst case being 119% of rating.	2023	-	-	Reinforce
Tividale	Fault level restriction on the 11kV switchboard and circuit breakers at Tividale PSS.	2024	-	-	Reinforce
Kitwell	Fault level restriction on the 132kV circuit breakers at Kitwell GSP.	2024	-	-	Reinforce

Table 3: Summary of investment decisions in South Wales

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Abergavenny - Crickhowell	Either of the 66kV circuits from Abergavenny is close to becoming overloaded following an N-1 circuit outage.	2025+	2025+	2025+	Signposting
Cardiff North	N-2 outage conditions and SD11 requirements.	2021	2021	2021	Reinforce with flexibility
East Aberthaw	Network secured outage compliance SD11.	2023	2021	2021	Reinforce with flexibility
Llandrindod - Rhayader	Llandrindod Wells 66/11kV PSS and Rhayder substation drop below statutory voltage limit when there is an N-1 of the T1 transformer at Llandrindod Wells.	2025+	2021	2021	Flexibility
Mountain Ash	Thermal & secured outage requirements.	2023	2021	2021	Flexibility
Pembroke	Pembroke South - Broadfield 33kV circuit and connected primary substation drop below the statutory voltage limit for the N-1 of the Golden Hill - St Florence 33kV circuit.	2022	2021	2021	Reinforce with flexibility
Trevaughan	Trevaughan PSS becomes thermally overloaded for an N-1 on of the substation transformers.	2025+	2021	2021	Flexibility
Aberaeron	N-1 restoration capacity for Aberaeron PSS restricted by 11kV backfeeds.	2025+	2021	2021	Flexibility
Llanfyrnach	N-1 restoration capacity for Llanfynach PSS restricted by 11kV backfeeds.	2025+	2021	2021	Flexibility
Nantgaredig	Voltage (11kV backfeed issues) and improved protection for rapid fault removal.	2021	-	-	Reinforce
Cefn Gwrgan	Fault level on Cefn Gwrgan/Grange 66kV ACBs.	2022	-	-	Reinforce

Table 4: Summary of investment decisions in the South West

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Western Approach	Western Approach transformer projected to exceed firm capacity.	2022	2021	2021	Signposting
Stokenham	N-1 capacity limited by 11kV backfeeds at Stokenham PSS.	2022	2022	2022	Signposting
Laneast	N-1 restoration capacity for Laneast PSS restricted by 11kV backfeeds.	2025+	2025+	2025+	Signposting
Plymouth/South Hams	Complex 132kV network constraints.	2022	2021	2021	Flexibility
Exeter City	N-1 of the 2x 132/33kV GTs at Exeter City BSP.	2023	2021	2021	Flexibility
Radstock	Circuit overload following a 33kV bar outage; 5km of 33kV overhead line overloaded.	2021	2021	2021	Reinforce with flexibility
Bridgwater/Street	An N-2 (outage - fault) has been considered at Bridgewater BSP.	2022	2021	2021	Reinforce with flexibility
Hayle - Camborne	The outage of the Rame-Hayle 132kV circuit over loads the 132kV circuit between Indian Queens-Fraddon-Camborne.	2022	2021	2021	Flexibility
Moretonhampstead	N-1 restoration capacity for Moretonhampstead PSS restricted by 11kV backfeeds.	2023	2021	2021	Reinforce with flexibility
Tiverton	Loss of either 132kV circuit leads to the risk of the opposite GT overloading at Tiverton BSP.	2025+	2021	2021	Flexibility
Taunton GSP	Bridgwater GSP and Taunton GSP require N-2 restoration for the loss of any of the SGTs in the group.	2021	2021	2021	Reinforce with flexibility
Weston Super Mare	N-1 outage has been considered for Weston BSP.	2025+	2021	2021	Reinforce with flexibility
Witheridge	Witheridge PSS limited for N-1 capacity by 11kV backfeeds.	2022	2021	2021	Reinforce with flexibility
Padstow	Overloading of transformers at Padstow PSS.	2025+	2021	2021	Flexibility
Roundswell	Firm capacity of transformers at Roundswell PSS is an issue due to recent large battery connection.	2023	2021	2021	Reinforce with flexibility

Table 4: Summary of investment decisions in the South West

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Truro - Truro Treyew	Truro-Truro Treyew Road 4L5 33kV Circuit becomes overloaded for the loss of the Truro 1L5 and 3L5 circuits.	2022	2021	2021	Reinforce with flexibility
East Yelland	Capacity of the grid transformers at East Yelland projected to be exceeded under a FCO condition.	2024	2021	2021	Flexibility
Hemyock	N-1 restoration capacity for Heymock PSS restricted by 11kV backfeeds.	2025+	2021	2021	Flexibility
Mullion	N-1 restoration capacity for Mullion PSS restricted by 11kV backfeeds.	2025+	2021	2021	Flexibility
Bridgwater	Fault level is anticipated to exceed switchgear rating in the near future. Change all 15 feeder breakers. Purchase breakers and build switchroom.	2022	-	-	Reinforce
Radstock Board	Fault level is anticipated to exceed switchgear rating in the near future.	2021	-	-	Reinforce
Taunton BSP	GT capacity and 33kV fault level. GT and 33kV switchboard now an asset replacement scheme.	2021	-	-	Reinforce
Weston - Bourneville	Replacement of isolators at Weston.	2022	-	-	Reinforce
Chudleigh Knighton	Overload of Chudleigh T2 for loss of Bovey and Chudleigh T1 at winter peak. Possibly install a CB at		-	_	Reinforce
Alexandra Road	Fault level of 33kV switchgear. Current access limitation. Scheme required to swap circuits to allow 33kV bar to run split. Due to increasing scope, costs and upcoming asset replacement it has been decided to proceed with a full board change and circuit reconfiguration.	2021	-	-	Reinforce

Table 4: Summary of investment decisions in the South West

Scheme	Constraint	Proposed Scheme Closure	WPD Best View Flexibility Start Year	DFES Scenarios Flexibility Start Year	DNOA Decision
Hayle	Equipment may fault at Hayle due to EPR during 33kv faults. Proposed to install new earthing transformers.	2021	-	-	Reinforce
Plymouth	Fault current is expected to exceed rating of bars and isolators in the near future. Change 132kV bars and isolators. Now operating with an SGT on hot standby to provide fault level headroom.	2022	-	-	Reinforce
Braunton/ Ilfracombe	Thermal and low voltage issues. Moving Georgham onto the West Hill PV circuit will remove voltage and thermal issues in network.	2021	-	-	Reinforce
Fraddon	First circuit outage overload in summer. Likely reconductoring of Fraddon - Burthy required.	2021	-	-	Reinforce
Newton Abbot	Under a FCO condition one of the 33kV busbar isolators becomes overloaded. Change transformer incomer and install inter-trip for busbar fault, change 33kV isolators and busbars as full scheme.	2021	-	-	Reinforce
Exeter Main	Fault level restriction on the 132kV busbars and isolators at Exeter Main GSP.	2024	-	-	Reinforce
Indian Queens	Fault level restriction on the 132kV busbars and isolators at Indian Queens GSP.	2023	-	-	Reinforce

1.1 Document Overview

This section aims to introduce the Distribution Network Options Assessment (DNOA). The primary functions of the DNOA are described, along with how the DNOA fits within existing WPD processes. The decisions outlined in this report are underpinned by the data in WPD's Distribution Future Energy Scenarios (DFES). The contents of each section of the DNOA are described below for navigational purposes.

Section 2: Methodology

This section describes the processes behind the creation of the DNOA, explaining some of the economic theory behind the investment decisions, along with a description of the tools used.

Section 3: Investment Decisions

In this section the investment decisions for each scheme are presented, along with a more in-depth description of why investment is required and what the associated costs for the different options are.

Section 4: Stakeholder Engagement

Feedback from various groups could help improve future publications of the DNOA. This section outlines how you can provide your views, and how this discussion will shape the DNOA.

Other data and information not included in the main report, along with a glossary to help readers understand industry nomenclature.

1.2 How DNOA complements WPD processes

Western Power Distribution produces many publications on the future of electricity across the Midlands, South West and South Wales. The Distribution Future Energy Scenarios (DFES) provides data on the predicted growth in generation and demand across the 4 licence areas on a yearly basis.

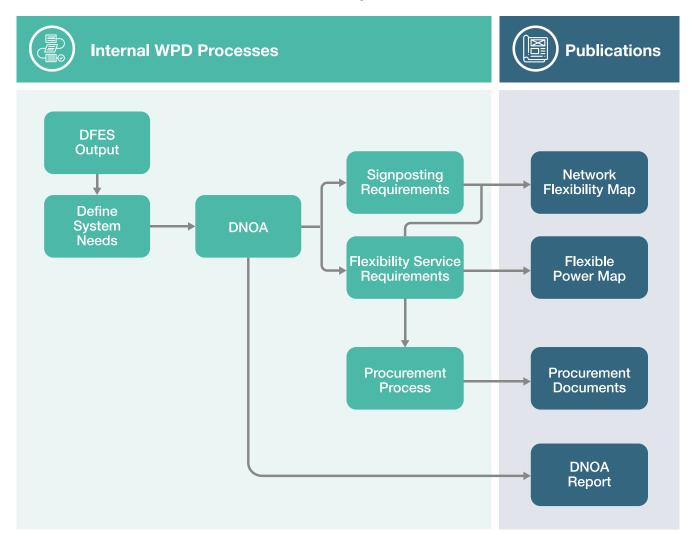

This scenario growth data allows areas on the network expected to be constrained to be identified. Forecasts carried out using this data are then used to plan conventional network build solutions and/or flexibility procurement based on system needs.

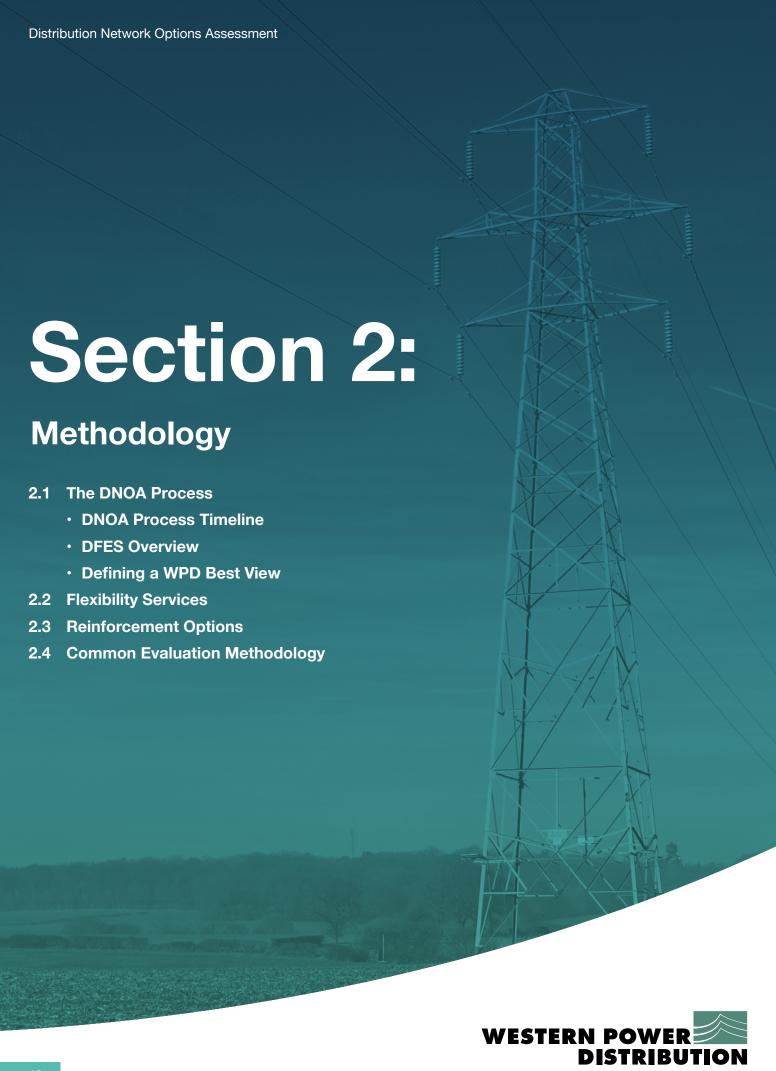

The decision making process for determining the optimal solution for each constraint is described in the DNOA. This is carried out on a biannual process, leading to two rounds of Flexibility Service Procurement each year.

The DNOA process is used to both look forward and identify which services should have services procured to help mitigate them, as well as looking backwards to ensure they continue to provide value. The outcomes of both process are summarised into a DNOA report, published every 6 months.

This process is summarised in the figure below.

The DNOA process

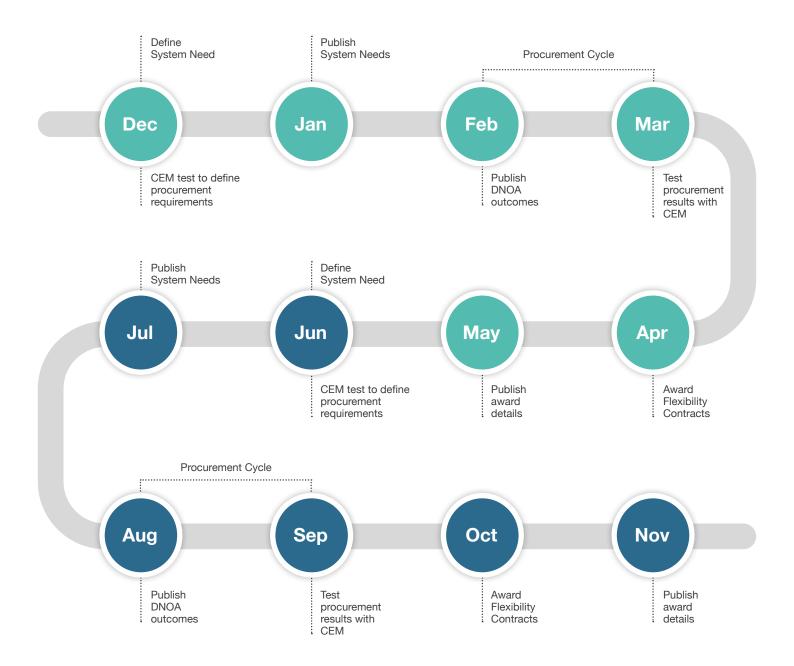

2.1 The DNOA Process

DNOA Process Timeline

The DNOA outcomes are published twice a year in February and August. In December the system needs are identified using data from the DFES. The CEM test is then used to define the procurement requirements.

The DNOA outcomes are published before the first procurement cycle between February and March. After the procurement cycle WPD checks that sufficient flexibility is available to manage each constraint. This will determine whether procurement will be needed in the next cycle. Finally, the flexibility contracts are awarded in April, with the details of these awards published in May. The cycle then repeats for the following 6 months.

2.1 The DNOA Process

DFES Overview

In this section the methodology used for the DNOA is highlighted, and the economic theory that underpins it is explained. As outlined in the introduction, the DNOA process begins with the Distribution Future Energy Scenarios (DFES).

Using local planning data, demand pipeline data and local engagement, a range of credible future scenarios are created that predict growth across WPD's 4 licence areas over the next 30 years.

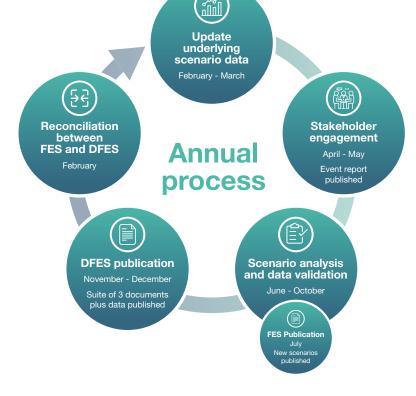

For this DNOA the data used was taken from the 2019 DFES for all 4 licence areas. In the past the DFES was produced on a 2 year rolling cycle for WPD's 4 licence areas. For this DNOA the scenarios will be referred to as Two Degrees, Community Renewables, Consumer Evolution and Steady Progression.

These 4 base scenarios encompass divergent levels of decentralisation and speeds of decarbonisation. The forecasting methodology used here is aligned with National Grid's Future Energy Scenarios (FES) and the projections made by other DNOs.

The DFES report is published once a year, with the scenarios changing to reflect the direction the energy landscape has taken, any legislative changes that have been revealed and expected customer behaviour driving increased growth rates.

Stakeholder engagement is held to get input on the approach and scenarios considered.

Finally, the FES and DFES are reconciled to ensure a consistent picture. These steps form a feedback loop that acts as an annual process to continually improve upon the DFES as shown on the right.

www.westernpower.co.uk/ distribution-future-energy-scenariosregional-information

2.1 The DNOA Process

Defining a WPD Best View

By amalgamating the four base scenarios, a 5th scenario is created which represents WPD's expectation of the most likely future growth, called WPD Best View, which is used to inform investment decisions.

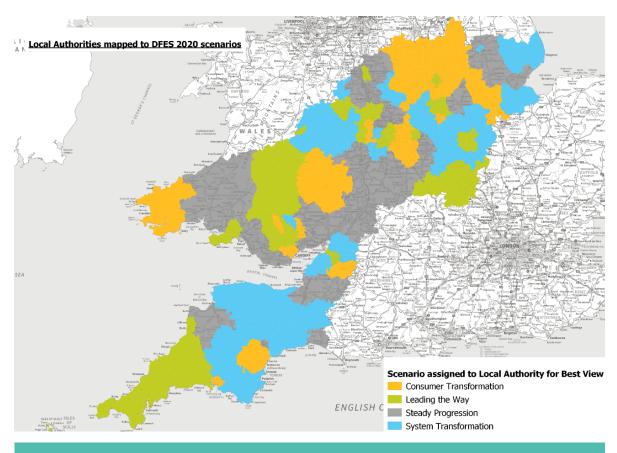

To derive the WPD Best View, WPD uses an iterative process. DFES data and previous Best View is used to support stakeholder and Local Area engagement, which then allows the quality of Local Area Energy Plans to be assessed using criteria derived from Ofgem guidance to gauge the ambition, engagement and deliverability.

The assessment is carried out by WPD's senior regional managers, scoring against the criteria matrix and a Local Area specific DFES scenario is selected.

The DFES scenario is chosen by closely comparing the ambition of the planned volumes across all technology types within the area, and then further ranked on how close this ambition is likely to be to the needs of stakeholders (engagement completed), how accurate the modelling is and the capability of the area to deliver.

A single DFES scenario is currently chosen to approximately represent all technologies, but there is scope in the future for differentiation between expected uptakes of technologies to also be simultaneously assessed. This process enables these scenarios volumes to be summated up to a licence area level, checked against WPD strategic views of development and a new WPD Best View can then be provided.

Before the WPD Best View is finalised, the licence area totals are checked against national ambition to ensure WPD targets are aligned to deliver governmental policy. Scenario boundaries across the rankings may be moved to more closely aligned, assuming incentives and policy is directed at achieving national Net Zero ambitions. Each primary substation also receives a disaggregation of this "WPD Best View" and this is used to inform the growth rates required for investment across the network.

This DNOA has been completed using data from DFES 2019. The next DNOA will use the DFES 2020 scenario framework.

2.2 Flexibility Services

WPD has always used the flexibility inherent in the distribution network to provide economic and secure supply ahead of undertaking conventional reinforcement. For the past few years this has also included market-provided flexibility. This flexibility is sought following a 6 monthly procurement cycle in areas triggering load related reinforcement.

These areas are known as Constraint Management Zones (CMZs), the figure below shows these areas as of July 2021. To date we have over 440MW of third party provided flexibility under contract.

To give providers and operators of flexibility services advanced notification of future needs, signposting information is provided for a 5 year window for each area on the network with forecasted constraints.

The three main flexibility products offered to providers are standardised across the Industry:

Secure

Used to manage peak demand loading on the network to pre-emptively reduce network loading.

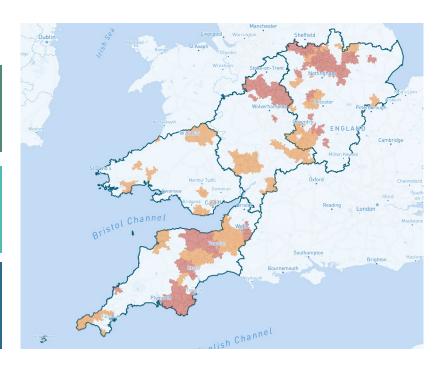

Dynamic

Developed to support the network in the event of specific outage conditions, namely maintenance work.

Restore

Supports power restoration following rare fault conditions.

The customer-facing brand for flexibility services established by WPD in 2017 is known as Flexible Power. The Flexible Power website allows businesses to confirm their eligibility for flexibility products and to begin the procurement process.

This process involves registering to be added to WPD's dynamic purchasing system, responding to a tender, setting up the API comms link required to receive stop/start signals, using the participant portal to declare asset availability and then receiving payments for utilised availability on a monthly basis.

Find out more at: www.flexiblepower.co.uk

2.3 Reinforcement Options

Reinforcement schemes aimed to alleviate constraints on the network can involve replacing a number of different assets, or installing new assets. Most conventional reinforcement will involve some combination of the four options below.

Upgrade existing circuits

Reconfigure existing substation

Circuit installations and upgrades can involve replacing or installing overhead line conductors and/or underground cables for 11kV, 33kV, 66kV or 132kV circuits. Substations considered for reinforcement include Primary Substations (PSS), Bulk Supply Points (BSP) and Grid Supply Points (GSP). Other options for managing constraints include System Voltage Optimisation (SVO), STATCOMs for reactive power management and other innovative solutions. In areas where multiple complex constraints are affecting a number of customers over a long period of time, Active Network Management (ANM) can also be implemented.

2.4 Common Evaluation Methodology

To improve transparency in how DNOs reach decisions for the flexibility procurement and the potential to delay conventional reinforcement, a Common Evaluation Methodology (CEM) cost-benefit analysis (CBA) tool has been created by Baringa Partners. This tool is used to assess the net benefit of flexibility against a baseline of conventional reinforcement for scenarios over a number of years.

The economic analysis is based on the Time Value of Money wherein delaying reinforcement costs creates a significant economic benefit. If this benefit is greater than the cost of flexibility required during the deferral period, then flexibility procurement is deemed the optimal solution and could create savings that can be passed on to customers and stakeholders.

Within the CEM CBA tool, the current capacity of an asset or assets on the network is compared with the projected load in the future. When the load exceeds the capacity of the asset or assets determines when and what intervention (in the form of flexibility procurement or conventional reinforcement) is required.

The amount of flexibility required and the cost of flexibility availability and utilisation is used to calculate the total cost of the flexibility option for each year.

The costs associated with reinforcement are fed in from the relevant scheme provided by the Primary Systems Design team. Additional functionality within the tool also allows the amount of losses incurred on the network to be considered in the cost-benefit analysis, as this will be affected by the investment decision made. The effects of flexibility on network losses are calculated using WPD's losses calculator.

By cultivating greater transparency in the decision making process and providing robust justifications for the investments made on the network, customers can be assured that their money is being utilised effectively. Flexibility providers will also be able to plan more effectively for the future in terms of the flexibility they wish to deliver. This will help encourage a more competitive market for flexibility to develop, resulting in further savings for customers.

Read more about the CEM process at the ENA website: https://www.energynetworks.org/newsroom/ena-standardises-approach-to-flexibility-for-gb-distribution-network-operators

Section 3:

Investment Decisions

- 3.1 Interpretation of DNOA outcomes
- 3.2 Outcomes East Midlands
- 3.3 Outcomes West Midlands
- 3.4 Outcomes South Wales
- 3.5 Outcomes South West

3.1 Interpretation of DNOA outcomes

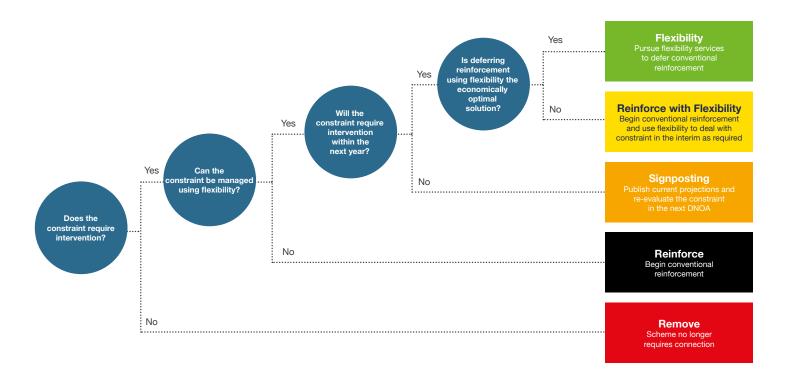

In this section the investment decisions taken on each scheme across WPD's four licence areas are given, along with information on the proposed reinforcement schemes, cost-benefit analysis results showing across which years and which scenarios is flexibility procurement the optimal economic choice and discussion on the other effects of the investment decisions (such as considerations of losses on the network).

The decision tree below demonstrates the different choices our analysis can lead to. Firstly, the schemes that do not require any intervention are removed from future DNOAs.

Among the schemes which do require intervention, if the constraint cannot be managed using flexibility then reinforcement is pursued. If the constraint can be managed using flexibility but no intervention is required within the next year signposting is published.

The schemes which require flexibility services within the next year are put through cost-benefit analysis to determine if flexibility can be used to defer reinforcement.

If CBA indicates reinforcement should not be deferred, reinforcement works will begin as soon as possible. For these schemes flexibility is used as required to manage the constraint and provide additional network security before the reinforcement is completed.

3.1 Interpretation of **DNOA** outcomes

Scheme Description

For each scheme presented in this DNOA the description will outline the constraint on the network that is being addressed, along with an overview of the proposed or ongoing reinforcement works to deal with said constraint.

For reinforcement schemes that are currently underway, the expected completion date will be given.

For reinforcement works that have not begun yet, the time it would take to complete said works is given in the EPRC.

EPRC: Earliest Possible Reinforcement Completion

This date shows when conventional reinforcement could be completed by if it were to begin immediately. For projects that have already begun, the expected end date is given.

If reinforce or reinforce with flexibility are chosen, this will reflect when the reinforcement will be completed in reality. If flexibility or signposting are chosen this date will not reflect the actual reinforcement completion timeline, as deferral will be taking place.

Scenario Key:

Optimal flexibility duration

For each scenario the years flexibility is expected to be required are shown, along with the estimated utilisation that will be required.

The start of this period will be triggered when the constraint begins to need management and end with reinforcement.

Estimated flex utilisation required per year table

The estimated flex utilisation required per year for every scenario is given for each scheme in MWh.

This should give an idea of the expected annual flexibility energy requirements across the optimal flexibility duration for each scenario. For more detailed data on this, a link to the Flexible Power website page for each scheme is provided.

Constraint management timeline

For each scheme the constraint management timeline shows what decision has been made for that scheme in each procurement cycle from when the scheme was created up to the upcoming procurement cycle.

Justification for decision

For each scheme the reasoning behind the DNOA decision is described. For schemes where flexibility is an option this decision is usually driven by the cost-benefit analysis; if this is not the case then this will be discussed.

For reinforce schemes the reason why flexibility was not viable will be given. For remove schemes the reasons why the constraint no longer needs intervention are given (e.g. reinforcement works have been completed).

Other Information

Also provided is the season (or seasons) the constraint being addressed is expected to arise (and therefore the season in which flexibility services are required) and the flexibility product expected to be utilised (secure or dynamic). Alongside the secure and dynamic products, the restore product will also be used.

Over 2.7 million customers are served within WPD's East Midlands licence area, with an annual maximum demand of around 4.8GW and a total of 25,638GWh distributed in 2019.

A resurgence in demand growth in the area is anticipated, driven by local authorities' plans for developments that will result in strong growth in domestic, industrial and commercial demand.

Following a wider trend across Great Britain, the East Midlands has experienced substantial growth in the connection of Distributed Generation (DG). There is now approximately 3.7GW of generation connected to WPD's East Midlands network, with a further 3GW accepted-not-yet-connected.

As both generation and demand in the East Midlands continue to grow the strain on the network increases, significant reinforcement and flexibility procurement is required.

In this DNOA, 42 schemes have been considered; an estimated $\mathfrak{L}4.7m$ worth of flexibility procurement over the next five years is recommended to defer some of the $\mathfrak{L}138m$ reinforcement works required to address the constraints.

Wigston

Scheme description

There are plans to modify the 132kV network at Wigston BSP in order to ensure the site remains P2/7 compliant. The demand on Wigston is nearing 100MW, meaning that there will soon be a requirement to be able to restore some demand under a SCO. It is proposed to loop in Wigston to the existing 132kV double circuit between Leicester and Kibworth and install a new 132kV double circuit from Carlton Park to Wigston.

Berkswell SGT

Scheme description

Berkswell GSP currents comprises 3 SGTs. Under National Grid's current maintenance regime one SGT is taken out per year. During this period NG requests that WPD reduce the load to within the cyclic rating of 1 SGT to cover a fault on one of the remaining SGTs. To ensure future compliance of the Berkswell Grid Group a 4th SGT will be installed. 132kV works will be done to facilitate this.

Staythorpe

Scheme description

Three phase break fault level has exceeded its rating. Replant Staythorpe B, total of 14 feeder bays.

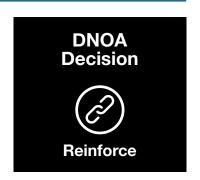

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2024

Current Status - Preliminary

Thurmaston

Scheme description

Three phase make fault level is 93.3% of rating. Replace 11kV switchgear on fault level.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2022

Current Status - Preliminary

Hawton-Bowbridge

Scheme description

Demand of 26MVA over 22/19MVA circuit rating. Remove overhead section and joint to connect cable to Bowbridge.

Justification for decision

Flexibility is not financially viable as the reinforcement cost is less than £150k.

Reinforcement Information

Completion Year - 2022

Regent Street

Scheme description

Landlocked site in poor condition, unable to upgrade transformer on existing site. Install new primary 33/11kV switchroom and associated plant.

Justification for decision

Reinforcement is condition-based/driven by lease expiry and thus cannot be deferred using flexibility.

Reinforcement Information

Completion Year - 2024

Current Status - Preliminary

Staveley 33kV

Scheme description

Insufficient demand disconnection for LFT to meet Grid Code. Install LFT panels at Staveley BSP and Whitwell BSP.

Justification for decision

Flexibility is not financially viable as the reinforcement cost is less than £150k.

Reinforcement Information

Completion Year - 2021

Current Status - In Construction

Willington

Scheme description

Fault level is likely to be overstressed, infrastructure rating unknown. Replant offline (16 bays).

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2024

Newton Road

Scheme description

Three phase make fault level is anticipated to exceed switchgear rating in the near future.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - TBD

Current Status - Preliminary

Staveley 11kV

Scheme description

Willington GSP compliance due to demand - transfer approx. 14MW off T3 onto Ratcliffe-Toton BSP group. Lay 2x 33kV circuits from Toton BSP to Long Eaton PSS. Pick up 33kV cable section to feed through to Ratcliffe PSS. Replace 3x transformers.

Justification for decision

Reinforcement is driven by asset replacement and thus cannot be deferred using flexibility.

Reinforcement Information

Completion Year - 2022

Current Status - In Construction

Nottingham North

Scheme description

Three phase make fault level is anticipated to exceed switchgear rating in the near future.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - TBD

Wolverton

Scheme description

Three phase make fault level is anticipated to exceed switchgear rating in the near future.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - TBD

Current Status - Preliminary

Long Eaton

Scheme description

Three phase make fault level is anticipated to exceed switchgear rating in the near future.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - TBD

Current Status - Preliminary

Walpole-Boston

Scheme description

It is proposed to overlay the two short sections of 132kV cables between the terminal tower (HW116) and Boston 132kV substation to match the overhead line rating. Incoming bus bars, line isolators and ancillary equipment identified as a restriction to circuit ratings will also be replaced within Boston 132kV substation.

Justification for decision

Reinforcement scheme is part of asset replacement. Internal analysis has also indicated there is no flexibility requirement.

Reinforcement Information

Completion Year - TBD

Rugby BSP

Scheme description

Replace the switchboard at Rugby BSP with a 22 panel 33kV switchboard rated to 2500A.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2024

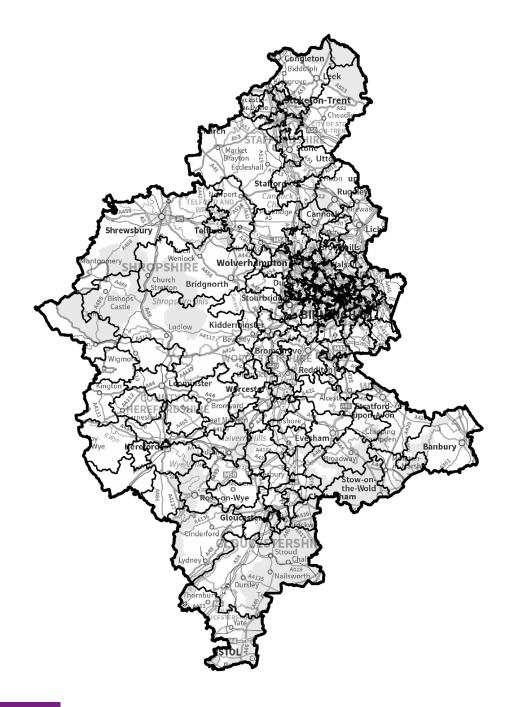

Almost 2.5 million customers are served within WPD's West Midlands licence area, with an annual maximum demand of around 4.6GW and a total of 23,229GWh distributed in 2019.

The West Midlands is showing similar signs of resurgence in demand growth to the East Midlands based on planned developments by local authorities.

The West Midlands has also experienced significant growth in the connection of Distributed Generation (DG).

There is now approximately 1.7GW of generation connected to WPD's East Midlands network, with a further 2GW accepted-not-yet-connected.

In this DNOA, 20 schemes have been considered; an estimated $\mathfrak{L}1.35m$ worth of flexibility procurement over the next five years is recommended to defer some of the $\mathfrak{L}52m$ reinforcement works required to address the constraints.

Bushbury

Scheme description

Bushbury is a 132/11kV site consisting of three transformers. Constraint here is the flow through two of the three transformers following an outage on the third. Reinforcement likely unnecessary as significant reservation of capacity expires in 2021. Will release over 40MVA of capacity for area.

Wapley

Scheme description

Opportunity is being taken during the asset replacement to improve network security and revise the running arrangement by installing 2 bus section CBs on the proposed new 33kV board, and a spare future Naishcombe circuit CB.

Justification for decision

Reinforcement is driven by asset replacement and thus cannot be deferred using flexibility.

Reinforcement Information

Completion Year - 2021

Current Status - In Design

Cellarhead

Scheme description

Cellarhead 132kV operates 7x 132kV circuits in a mesh. Under various SCO conditions, various 132kV circuits potentially overload. Proposed new 132kV circuit between Cellarhead and Whitfield (with new 132kV bays at Cellarhead and Whitfield).

Justification for decision

Not financially feasible for flexibility. The complexity and interaction with demand/generation resulting in different constraints based on different outages, plus the impact of SP Manweb, make flexibility more unsuitable here.

Reinforcement Information

Completion Year - 2023

Current Status - In Design

Tividale

Scheme description

Replace the 11kV switchboard and circuit breakers to increase the fault level limit at Tividale PSS.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2024

3.3 - Outcomes West Midlands

Kitwell

Scheme description

Replace the 132kV circuit breakers at Kitwell GSP to uprate its fault level capacity.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2024

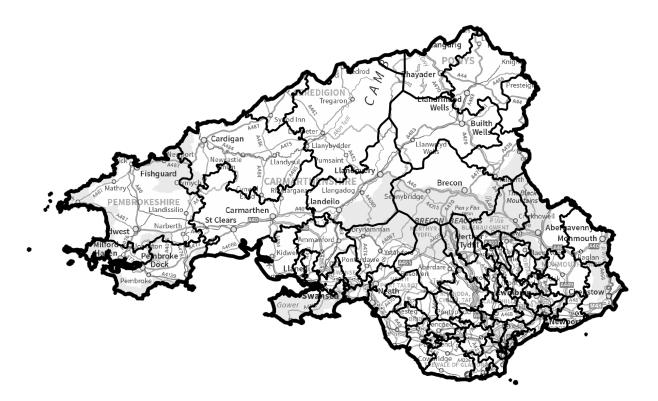

Over 1.1 million customers are served within WPD's South Wales licence area, with an annual maximum demand of around 1.9GW and a total of 10,987GWh distributed in 2019.

There is now approximately 2.2GW of generation connected to WPD's South Wales network, with a further 3GW accepted-not-yet-connected.

Despite recent changes to renewable energy subsidies driving a reduction in the volume of Distributed Generation (DG) and other Distribution Energy Resources (DER) seeking connection, there is still over 900MW of predominately low carbon generation waiting to be built in the region.

Much of this is made up of on-shore wind connections.

In this DNOA, 11 schemes have been considered; an estimated £930,000 worth of flexibility procurement over the next five years is recommended to defer some of the £37m reinforcement works required to address the constraints.

Abergavenny - Crickhowell

Scheme description

The northern 66kV ring in Mid Wales is supplied by two 66kV circuits from Abergavenny. Either circuit is close to becoming overloaded following a FCO. Proposed solution to remove all issues associated with increasing group demand would be to construct a 3rd 66kV injection into the group by building a new 132kV circuit from Rassau GSP.

Mountain Ash

Scheme description

A FCO condition resulting in the loss of a 275/33kV SGT at Upper Boat GSP. It is common practice for the 33kV networks to be 'split' following the loss of an Upper Boat SGT by opening the 33kV 8L5 bus-section circuit breaker at Upper Boat and 4L5 circuit breaker at Wattstown towards Tonypandy. As a result, Mountain Ash GT2 is left to supply a sizable share of the group and is projected to become overloaded with increasing group demand. Proposed reinforcement is to install a 132kV circuit breaker bay, a 132/33kV GT and a 33kV GIS circuit breaker bay.

Procurement

Procurement

Pembroke

Scheme description

The fault of the Golden Hill to Jordanston Farm 33kV circuit leaves a considerable length of 33kV network including St Florence, Tenby and Broadfield supplied via Haverfordwest BSP. The step voltage change in this area following this FCO condition can cause the 33kV network voltage to fall below statutory limits. This first circuit fault begins to heavily load the Haverfordwest to Broadfield 33kV circuit. Proposed reinforcement is to install a new 33kV circuit between Goldenhil BSP and Broadfiled primary, plus 2 new circuit breaker bays.

Completion Year - 2021

Current Status - In Design

Cefn Gwrgan

Scheme description

Fault level driven, upgrade 4 x 66kV ACBs.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2022

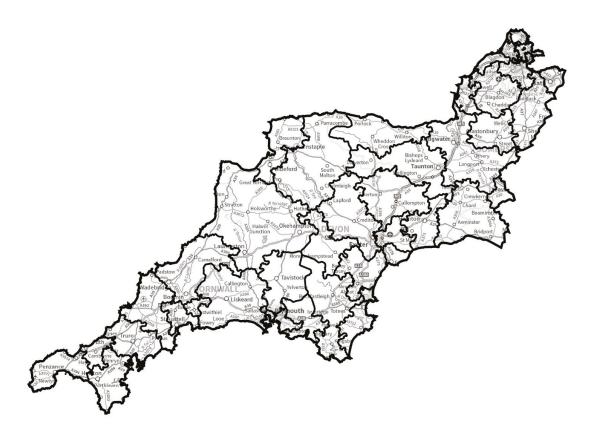

Over 1.6 million customers are served within WPD's South West licence area, with an annual maximum demand of around 2.6GW and a total of 13,221GWh distributed in 2019.

The growth of Distributed Generation (DG) across Great Britain is particularly evident in the South West, driven in part by the abundance of renewable resources in the area.

There is now approximately 2.3GW of generation connected to WPD's South West network, with a further 1.1GW accepted-not-yet-connected.

Although the reduction in subsidies for generation (most notably in solar photovoltaic installations) has slowed the speed of DG deployment, the demand for new connections is still high.

In this DNOA, 32 schemes have been considered; an estimated $\mathfrak{L}2.9m$ worth of flexibility procurement over the next five years is recommended to defer some of the $\mathfrak{L}70m$ reinforcement works required to address the constraints.

Western Approach

Scheme description

Following the connection of further demand the firm transformer capacity is projected to be exceeded in the near future at Western Approach PSS. 11kV works are proposed to deal with this constraint.

DNOA Decision

Flexibility

Justification for decision

Current flexibility contracts are adequate to deal with the constraint, and will be kept active. Cost-benefit analysis indicates flexibility is the optimum solution until at least 2022 (2024 under Best View).

2020 H2

Truro - Truro Treyew

Scheme description

For SCO condition (also FCO for a 33kV busbar fault) a potential overload occurs on the Truro - Truro Treyew Road 33kV circuit following connection of additional demand at Willow Green/Langarth. This condition exists irrespective of the Truro 33kV network being run in parallel with GT1 at Fraddon.

East Yelland

Scheme description

East Yelland is a 132/33kV BSP fed via two 132/33kV transformers. Following recent reassessment, the firm capacity of the site is now limited to 60MVA. The maximum demands projected by our Distribution Future Energy Scenarios are set to exceed the capacity of the site, which is leading to a constraint.

DNOA Decision

Flexibility

Justification for decision

Flexibility procurement is necessary. Cost-benefit analysis indicates flexibility is the optimum solution until at least 2025 (2025+ under Best View).

Constraint management timeline

2021 H2 Procurement

Bridgwater

Scheme description

Fault level is anticipated to exceed switchgear rating in the near future. Change all 15 feeder breakers. Purchase breakers and build switchroom.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2022

Current Status - In Construction

Radstock Board

Scheme description

Fault level is anticipated to exceed switchgear rating in the near future.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2021

Current Status - In Construction

Taunton BSP

Scheme description

GT capacity and 33kV fault level. GT and 33kV switchboard now an asset replacement scheme.

Justification for decision

Reinforcement is driven by asset replacement and thus cannot be deferred using flexibility.

Reinforcement Information

Completion Year - 2021

Weston - Bourneville

Scheme description

Replacement of isolators at Weston.

Justification for decision

Flexibility is not financially viable as the reinforcement cost is less than £150k.

Reinforcement Information

Completion Year - 2022

Current Status - Preliminary

Chudleigh Knighton

Scheme description

Overload of Chudleigh T2 for loss of Bovey and Chudleigh T1 at winter peak. Possibly install a CB at Chudleigh to prevent Chud T1 and Bovey going off simultaneously. Reinforcement alongside 11kV board change.

Justification for decision

Flexibility is not financially viable as the reinforcement cost is less than £150k.

Reinforcement Information

Completion Year - 2021

Current Status - In Construction

Alexandra Road

Scheme description

Fault level of 33kV switchgear.
Current access limitation. Scheme required to swap circuits to allow 33kV bar to run split. Due to increasing scope, costs and upcoming asset replacement it has been decided to proceed with a full board change and circuit reconfiguration.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2021

Current Status - In Design

Hayle

Scheme description

Equipment may fault at Hayle due to EPR during 33kv faults. Proposed to install new earthing transformers.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is an earthing restriction.

Reinforcement Information

Completion Year - 2021

Current Status - Preliminary

Plymouth

Scheme description

Fault current is expected to exceed rating of bars and isolators in the near future. Change 132kV bars and isolators. Now operating with an SGT on hot standby to provide fault level headroom.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2022

Current Status - Preliminary

Braunton/Ilfracombe

Scheme description

Thermal and low voltage issues. Moving Georgham onto the West Hill PV circuit will remove voltage and thermal issues in network.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2021

Fraddon

Scheme description

First circuit outage overload in summer. Likely reconductoring of Fraddon - Burthy required.

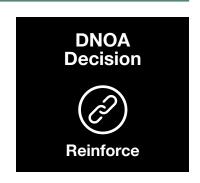

Justification for decision

Flexibility is not financially viable as the reinforcement cost is less than £150k.

Reinforcement Information

Completion Year - 2021

Current Status - In Design

Newton Abbot

Scheme description

Under a FCO condition one of the 33kV busbar isolators becomes overloaded. Change transformer incomer and install inter-trip for busbar fault, change 33kV isolators and busbars as full scheme.

Justification for decision

Flexibility is not financially viable as the reinforcement cost is less than £150k.

Reinforcement Information

Completion Year - 2021

Current Status - In Construction

Exeter Main

Scheme description

Replace the 132kV busbars and isolators and reinforce the earthing grid to provide a higher fault level rating at Exeter Main GSP.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2024

Indian Queens

Scheme description

Replace the 132kV busbars and isolators and reinforce the earthing grid to provide a higher fault level rating at Indian Queens GSP.

Justification for decision

Flexibility is not suitable to deal with this constraint as it is a fault level restriction.

Reinforcement Information

Completion Year - 2023

4.1 Stakeholder Engagement

We want to hear your views on the DNOA process and our report format as feedback from stakeholders will be valuable in shaping future publications.

In order to do this we aim to collect feedback after every publication and use this to improve the DNOA process and ensuring the data we publish is relevant and valuable.

The high level timeline for stakeholder feedback is shown opposite.

We are keen to get your feedback

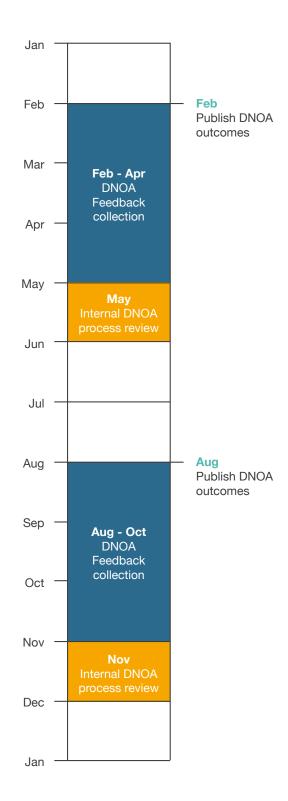

It is important that we get a broad range of stakeholders' opinions and we are keen to get your feedback.

Responses should be returned to: Network Strategy Team Western Power Distribution Feeder Road Bristol BS2 0TB

Or emailed to:

wpdnetworkstrategy@westernpower.co.uk

Section 5:

Appendices

Appendix A: CBA Results Example

Appendix B: Glossary

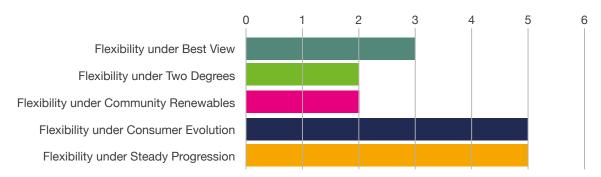

Appendix A: CBA Results Example

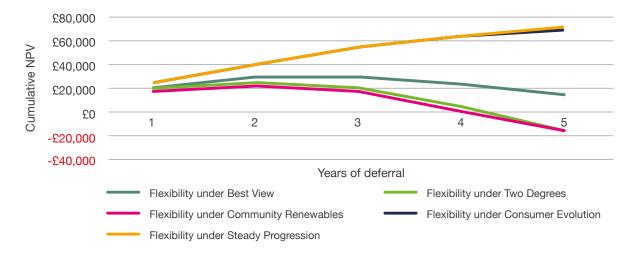

The results of the cost-benefit analysis performed using the CEM CBA tool for the Alfreton scheme are shown below.

Along with the optimum deferral length recommended, the Net Present Value (NPV) generated by flexibility procurement compared to a baseline of conventional reinforcement is given. These values may be included in future DNOAs to demonstrate the savings that are expected to be generated by the investment decisions chosen.

Optical reinforcement deferral duration by strategy and scenario

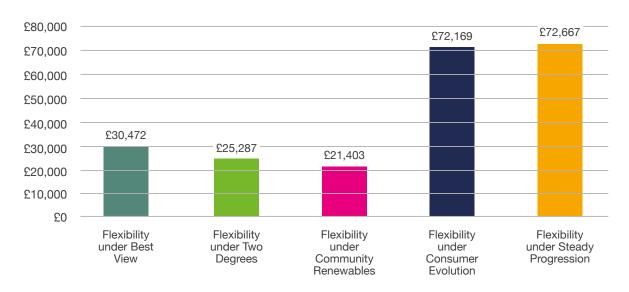

Cumulative NPV of deferring by a number of years vs the baseline strategy

Appendix A: CBA Results Example

NPV of optimal reinforcement deferral by strategy by scenario

Cumulative benefit of deferral	Baseline	1 Defer by 1 year(s) to 2022	2 Defer by 2 year(s) to 2023	3 Defer by 3 year(s) to 2024	4 Defer by 4 year(s) to 2025	5 Defer by 5 year(s) to 2026
Flexibility under Best View	£0	£20,830	£29,566	£30,472	£24,009	£14,646
Flexibility under Two Degrees	£0	£19,211	£25,287	£20,299	£3,573	-£18,198
Flexibility under Community Renewables	£0	£18,018	£21,403	£16,011	£519	-£17,531
Flexibility under Consumer Evolution	£0	£25,738	£41,778	£54,628	£64,324	£71,169
Flexibility under Steady Progression	£0	£25,719	£41,759	£54,842	£64,955	£72,667

Appendix B: Glossary

Active Network Management (ANM)

The ENA Active Network Management Good Practice Guide [22] summarises ANM as: Using flexible network customers autonomously and in real-time to increase the utilisation of network assets without breaching operational limits, thereby reducing the need for reinforcement, speeding up connections and reducing costs.

Alternating Current (AC)

An electric current which periodically reverses its direction, having a magnitude that varies continuously. The rate at which the current's direction changes is known as the frequency. The frequency for UK power systems is 50Hz.

Bulk Supply Point (BSP)

A substation comprising one or more Grid Transformers and associated switchgear.

Common Evaluation Methodology (CEM)

A process used to select the most suitable solution to meet network needs (between traditional network asset solutions (reinforcement) and procuring flexibility services from generators, storage operators or demand side response). Created within an Open Networks project under Workstream 1A. By establishing a standard approach for all DNOs it is hoped that transparency in investment decision making can be improved.

Constraint Management Timeline

A timeline showing what decision has been made for each scheme in each procurement cycle from when the scheme was created up to the upcoming procurement cycle.

Constraint Management Zone (CMZ)

An area identified by WPD in which flexibility procurement could potentially be used to manage a network constraint.

Conventional Reinforcement

Network investment involving installing or upgrading infrastructure and network assets. Also referred to as traditional reinforcement.

Cost-Benefit Analysis (CBA)

Economic analysis aimed at ascertaining which network investment pathway provides the highest overall benefit relative to its costs. Performed for this DNOA using the Common Evaluation Methodology CBA tool.

Demand

The consumption of electrical energy.

Distributed Generation (DG)

Generation connected to a distribution network. Sometimes known as Embedded Generation.

Distribution Future Energy Scenarios (DFES)

A set of scenarios developed by WPD to represent credible future paths for the energy development within the Midlands, South West and South Wales.

Distribution Network Operator (DNO)

A company licenced by Ofgem to distribute electricity in the United Kingdom who has a defined Distribution Services Area.

Distribution System Operator (DSO)

A role which may be established in the future whereby the DNO undertakes some of the roles of the GBSO at a regional level to balance supply and demand.

DNOA Decision

The outcome recommended by this iteration of the DNOA to manage each constraint most economically.

Dynamic

One of the flexibility products offered by WPD. Developed to support the network in the event of specific fault conditions, namely maintenance work.

Earliest Possible Reinforcement Completion (EPRC)

This date shows when conventional reinforcement could be completed by if it were to begin immediately. For projects that have already begun, the expected end date is given.

Energy Networks Association (ENA)

The Energy Networks Association is an industry association funded by gas or distribution or transmission licence holders.

Ethylene Propylene Rubber-insulated cable (EPR)

Ethylene propylene rubber-insulated cable is a common underground cable construction type used in the UK.

First Circuit Outage (FCO)

P2/7 defines a First Circuit Outage as: "a fault or an arranged circuit outage". Also referred to as N-1 in some contexts.

Flexible Power

The customer-facing brand for flexibility services established by WPD in 2017.

Future Energy Scenarios (FES)

A set of scenarios developed by Nation Grid to represent credible future paths for the energy development of the United Kingdom.

Great Britain (GB)

A geographical, social and economic grouping of countries that contains England, Scotland and Wales.

Grid Supply Point (GSP)

A substation comprising one or more Super Grid Transformers and associated switchgear.

Grid Transformer (GT)

A transformer that steps voltage down from 132kV to 66kV, 33kV or 11kV.

Low Frequency Tripping (LFT)

Low frequency tripping is a protection system which disconnects demand automatically under low frequency events.

Appendix B: Glossary

National Grid (NG)

The Transmission Network Operator in England and Wales.

Office of Gas and Electricity Markets (Ofgem)

Ofgem is responsible for regulating the gas and electricity markets in the United Kingdom to ensure customers' needs are protected and promotes market competition.

Optimal Flexibility Duration

The years flexibility is expected to be required for each scheme. The start of this period will be triggered when the constraint begins to need management and end with reinforcement.

Primary Distribution

The sections of an electrical distribution network which provide the interface between transmission and primary or Secondary Distribution. In WPD's network the 33kV circuits and Primary Substations are considered to be Primary Distribution.

Primary Substation (PSS)

A substation comprising one or more primary transformers and associated switchgear.

Primary Transformer

A transformer that steps voltage down from 66kV or 33kV to 11kV or 6.6kV.

Procurement Cycle

6 monthly periods that cover one full cycle of WPD's flexibility analysis and procurement process.

Restore

One of the flexibility products offered by WPD. Used to support power restoration following rare fault conditions.

Second Circuit Outage (SCO)

P2/7 defines a Second Circuit Outage as: "a fault following an arranged circuit outage". Also referred to as N-1-1 or N-2 in some contexts.

Secure

One of the flexibility products offered by WPD. Used to manage peak demand loading on the network to pre-emptively reduce network loading.

Short term operating reserve (STOR)

Short term operating reserve is an ESO service which provides additional power from generation export or demand reduction.

Signposting

Data published by WPD in the DNOA and on the Flexible Power website to inform providers of potential future flexibility opportunities.

Statement of Works (SoW)

The process under which DNOs request that National Grid assesses the potential impact of the connection of DG upon the National Electricity Transmission System.

Super Grid Transformer (SGT)

A transformer that steps voltage down from 400kV or 275kV to 132kV, 66kV or 33kV.

United Kingdom (UK)

A geographical, social and economic grouping of countries that contains England, Scotland, Wales and Northern Ireland.

Western Power Distribution (WPD)

A Distribution Network Operator (DNO) company that is licenced by Ofgem to distributed electricity in the East Midlands, West Midlands, South West, and South Wales regions of the United Kingdom.

Western Power Distribution (East Midlands) plc, No2366923 Western Power Distribution (West Midlands) plc, No3600574 Western Power Distribution (South West) plc, No2366894 Western Power Distribution (South Wales) plc, No2366985

Registered in England and Wales Registered Office: Avonbank, Feeder Road, Bristol BS2 0TB
