ECO CAR

I used solar panels on my roof to use less energy and let the hamsters rest. The seats are made out of reused fabrics and memory foam.

The grass is used so we can plant food for the animals (Hamsters) and so it can rain on the food and shine the sun on it.

The whole car is made out of scrap/ reused metal.

This car is not run on petrol or diesel so it doesn't pollute the environment and hurt the animals homes.

The Led lights are used so that we use less energy.

The bright colours are used to reflect of the sun and to be seen easily in the dark.

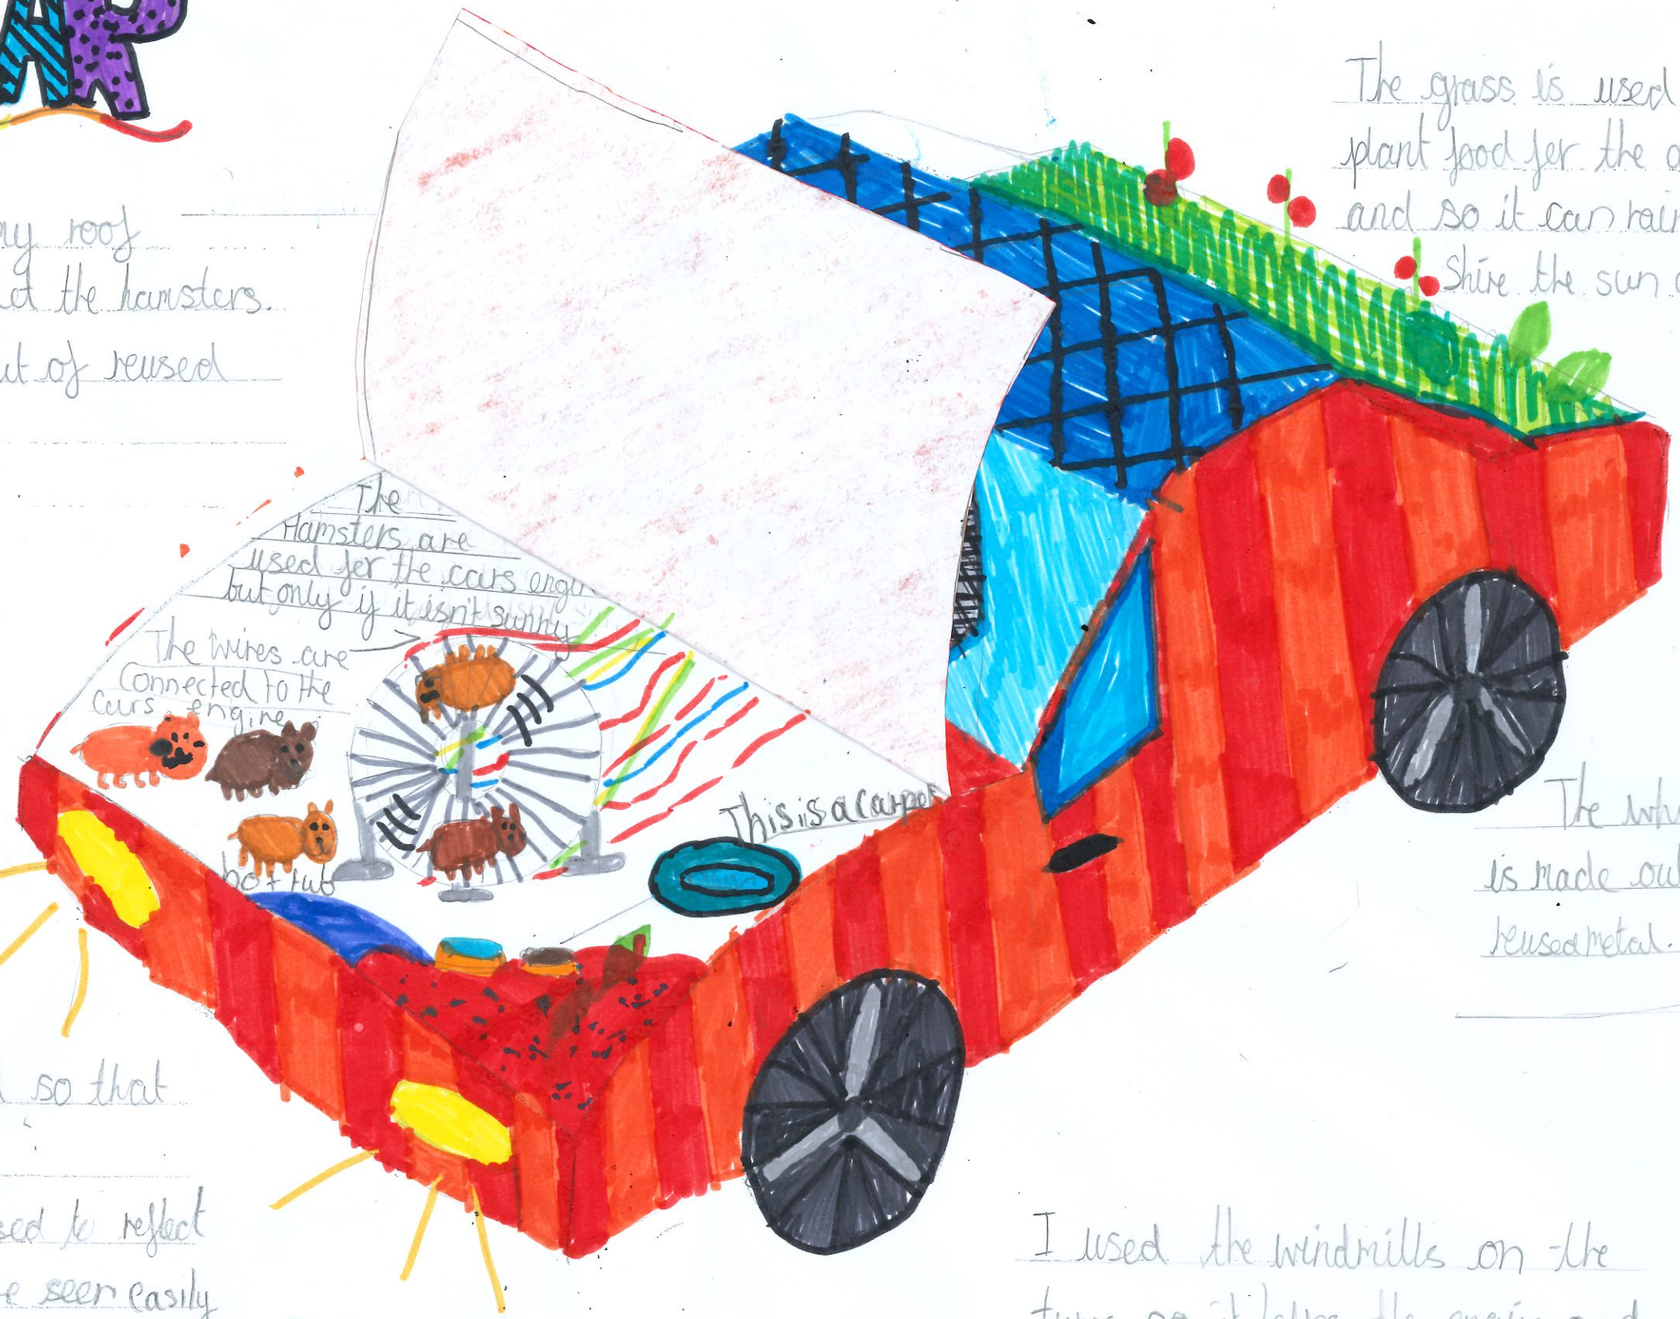

I used the windmills on the tyres so it helps the engine and makes the tyres move. It also charges the batteries.
